## A2.1 Inform ideas in response to a creative brief

### Interpreting a brief, a set of constraints or creative challenges

#### Client Brief:

For this project, I am my own client. I have tasked myself with creating a 3D digital model. The purpose of the model is to present my interest and skill in architecture. It is also to be used in my portfolio for university and job applications. The model must create a modern and sophisticated appearance to its viewers with use of simple and neutral colours. I would like for the model to be a modern 3D house which incorporate key features. For example, the model should use housewarming furniture to create an eye-catching feel. The model should also be aimed at future employers and university application officers as it should capture their attention because it is a portfolio design.

Project Proposal

 Timmy Adekoya

Dear Timmy,

I would like for you to help me build a 3d modern house model. I am asking this of you because I would like to showcase sometimes later in the future. There is limited timespan for you to help create this model. The time scope available for this project is 3month. During that time, I will be available for any meetings, checkups and review you would like from me. Please feel free to conduct a general Q&A for the project. The target audience for this project are employers and university application officers and at this point I believe you should be able to know the project intended purpose(Portfolio).

Here are the success criteria required for the project.

1. Fully functional
2. Aesthetically pleasing
3. Household materials such as furniture, storage cupboard and a bed, etc.
4. Adherence to the timescale
5. Meets consumer needs

Yours Sincerely  
Oluwatimilehin Blessing.

 Reply  Forward

The project has a three -month timescale as stated by the client email. This time includes modelling, regular check-ins with the client and Q&A sessions for review and progress update, all which must be allocated within this period so the process must be structured. There is no financial budget as the project take places within the school premises with all the software needed. The software I will be using for this project is 3D MAX which is a very efficient software for 3d modelling. As the target audience are future employers and university application officers, the model must meet a professional standard.

## Investigating and analysing existing work

From the investigation, existing 3D house models commonly use realistic visualisation design processes with clean lines and large windows. The models concentrate significantly on the exterior details of the houses, rarely showcasing the interiors. The images are presented in a studio style avoiding atmospheric conditions like sunlight, solely focusing on the building. They also don't show environments or locations.

However, they follow clear and common design trends incorporating the use of simple and neutral colours like white, grey and brown to visually showcase the model professionally. They also make use of simple geometric shapes like rectangle and square which helps to create models easily and efficiently. My project will follow the same studio format to avoid distraction from the actual model, allowing for the viewers to focus entirely on the detail of the model.

### Interpreting meaning, purpose, impact and function in others' work:

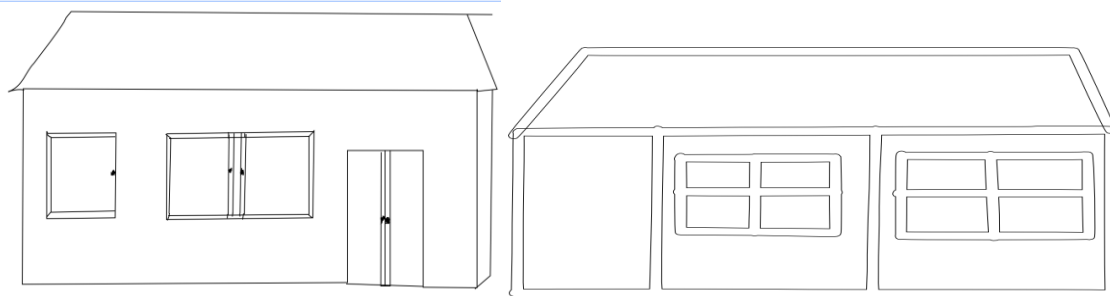

On the project, I will maximise the use of warm lighting to make the design appear welcoming and create a cosy environment. This creates a sense of comfort and hospitality. It is a useful design trend that gives the model a realistic and clean look. I will also make use of neutral colours as earlier mentioned to evoke emotions, it helps to portray the design efficiently as it captures the viewers' attention immediately, alongside this it makes the model appear very modern and professional which is the aim in the client brief. However, the use of many colours can easily distract the attention of the audience. For example, the use of the rainbow colour scheme can make the model appear childish and unprofessional and with this consideration I will try to use within 3 -5 colours to avoid overload and stray from the focal point. The design will incorporate simple geometric shapes and forms to easily construct the model. This helps to easily comprehend the scale and flow of the building by showcasing its visual concepts which makes the design more appealing. Furthermore, the use of simple geometric shapes and forms are recognised globally which

an easy approach for the client and target audience to understand instantly. For example, combining a large rectangular wall with a triangle top can easily be seen as an early stage in the design process of a house even by a kid. My design follows the genre of modern architectures which includes the use of clean lines, neutral colours and simple geometric forms to create a clear appearance.

## **A2.2 Apply problem solving skills in response to a creative brief**

### **Generating ideas**

For this project, I will be developing a modern bungalow house as most modern homes are flat roofs and tall walls. This project will be unique and to achieve this, it must be distinguishable and distinctive. The layout of the project is to design a functional house by creating a flow between each room making the house feel very connected and easy to navigate. The flow is important because it improves usability and accessibility. This layout provides structure within the house. The bungalow will display a range of rooms to capture the essence of a home including; kitchens, bedrooms & rooms. This helps to create a feeling of belonging and comfort across the eyes of its viewers. Living room will be placed at the front of the house for social interaction and everyday relaxation. Bedrooms are placed at peaceful sections of the house for example, the back corner to provide privacy, this is very efficient as it is the furthest away from attention, while other rooms are placed strategically around the structure.

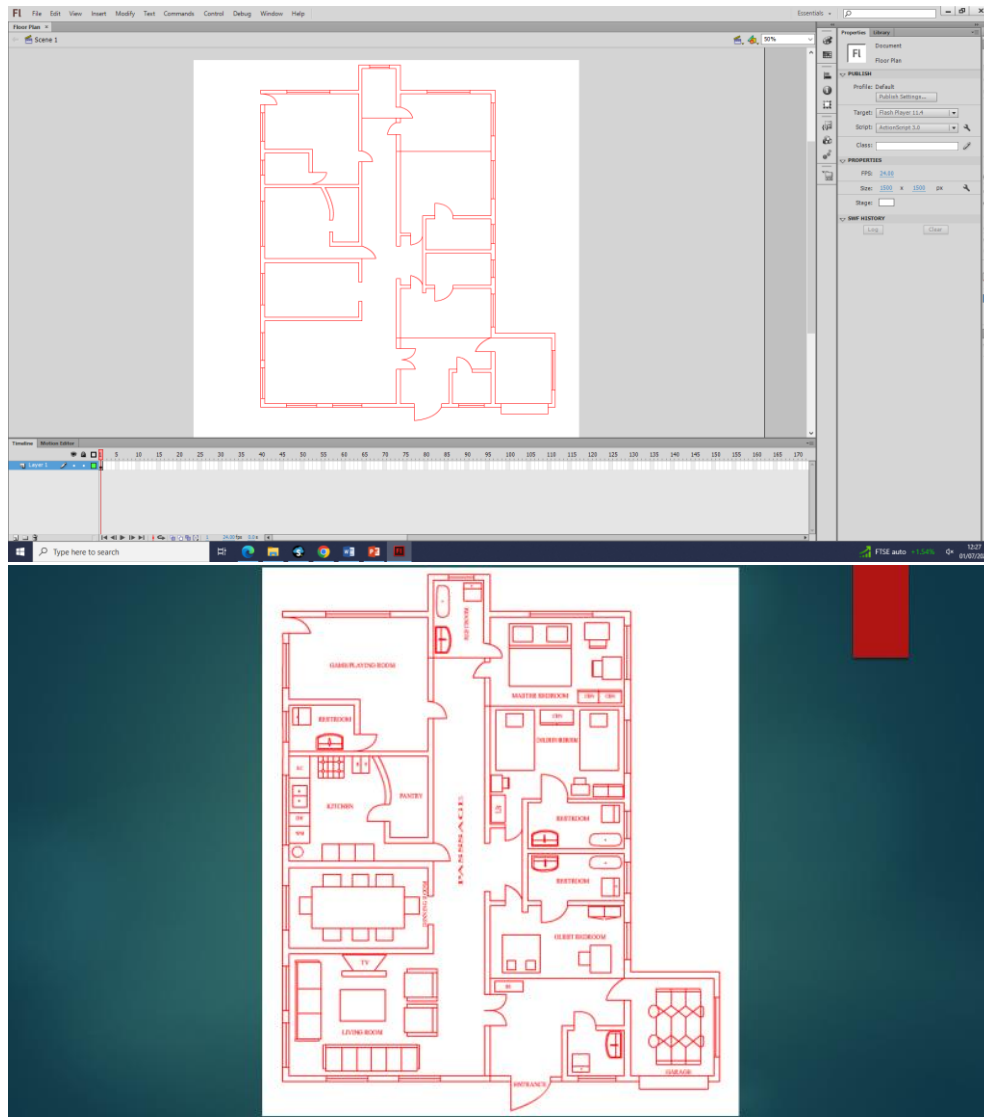

From the rough sketches, the aim is to create a really wide and spacious house capable of housing guests. I am leaning into creating a model suitable for a family of five and can be easily adapted for more or less. Adaptability is possible because the house design is to be spacious allowing for expansion or rearrange ability of the room positions.

There are a range of modern house I will be taking inspirations. I will try to incorporate the roof styles from the images above. The roofs strengthen the authenticity because they make use of simple geometry and are easier to model accurately. Furthermore, I will follow the rectangular structure of the building to create a realistic modern bungalow as this shape is very practical which makes the model easy to build. These features ensure the model stay realistic.

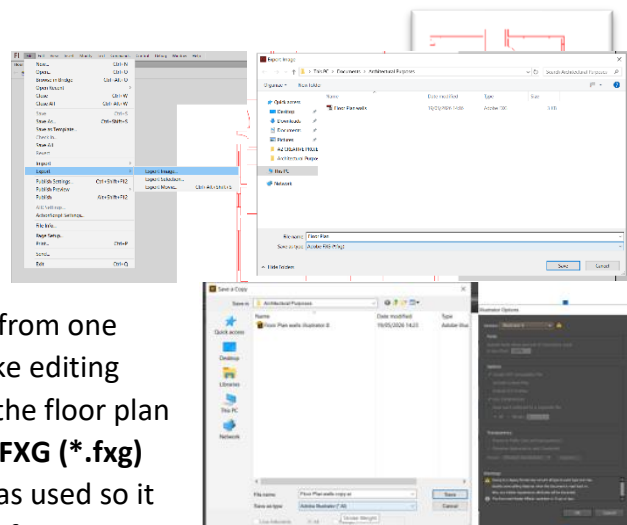

## Pre-Production stages and design development

### A2.3 Apply technical skills in response to a creative brief

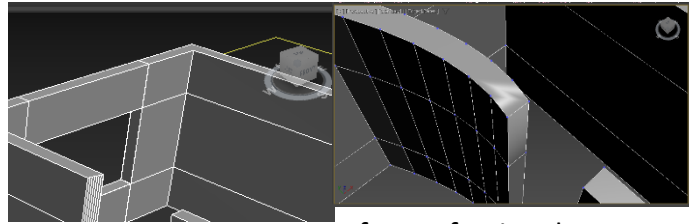

#### Production/development.

I started by using Adobe flash software which was excellent as it allowed for lines to be formed and connected to generate a floor plan that can be used to develop the modern house. It is an effective software that is easy to manoeuvre and also allows for different saving formats to be imported from one software to another for further processes like editing and rendering. After which I then exported the floor plan from Adobe Flash and saved it as an **Adobe FXG (\*.fxg)** file. The saving format **Adobe FXG (\*.fxg)** was used so it could be imported to **Adobe Illustrator**. The format was highly efficient because it can handle the complex layouts of the floor plan without losing its

quality. The floor plan was then saved on '**Adobe Illustrator version: Illustrator 8**' format so it could be imported as clean vector lines into 3D Modelling programs. This was essential to meet the client's demand

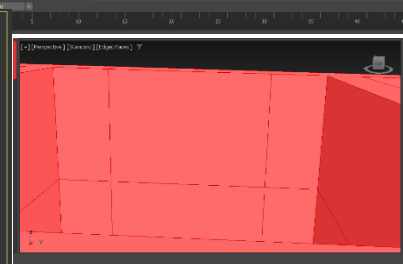

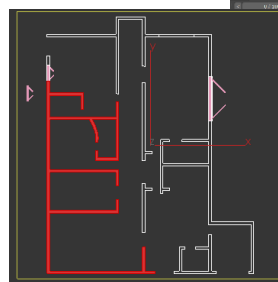

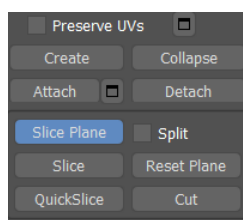

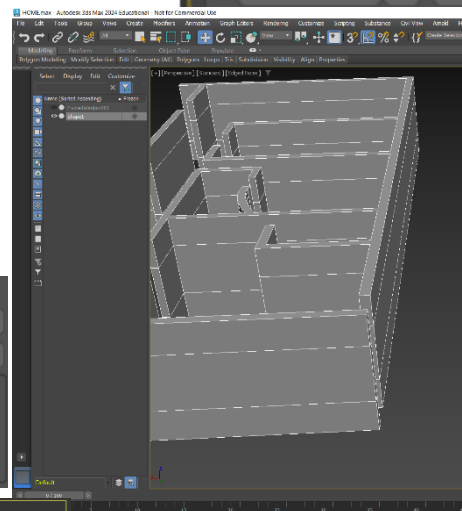

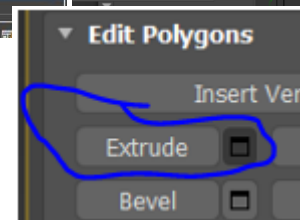

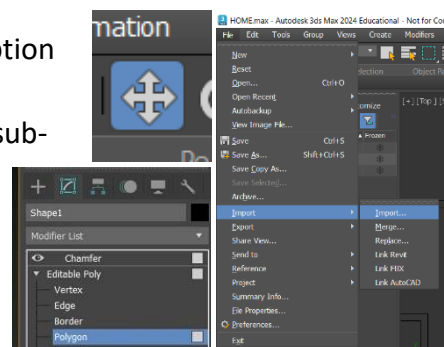

for professional

standards allowing for the files to remain compatible across different software. It is very robust as the file can be easily read on any 3D manufacturing software without compressing the file; for example, 3ds Max can interpret the file seamlessly while it keeps its structure without breaking compatibility with old tools. Afterwards, I went ahead and imported the file into 3ds Max software. I used this software because it allowed for precise 3D modelling to be created and also for its magnificent rendering capabilities.

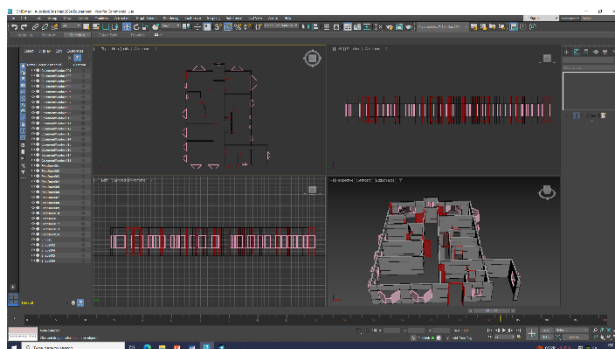

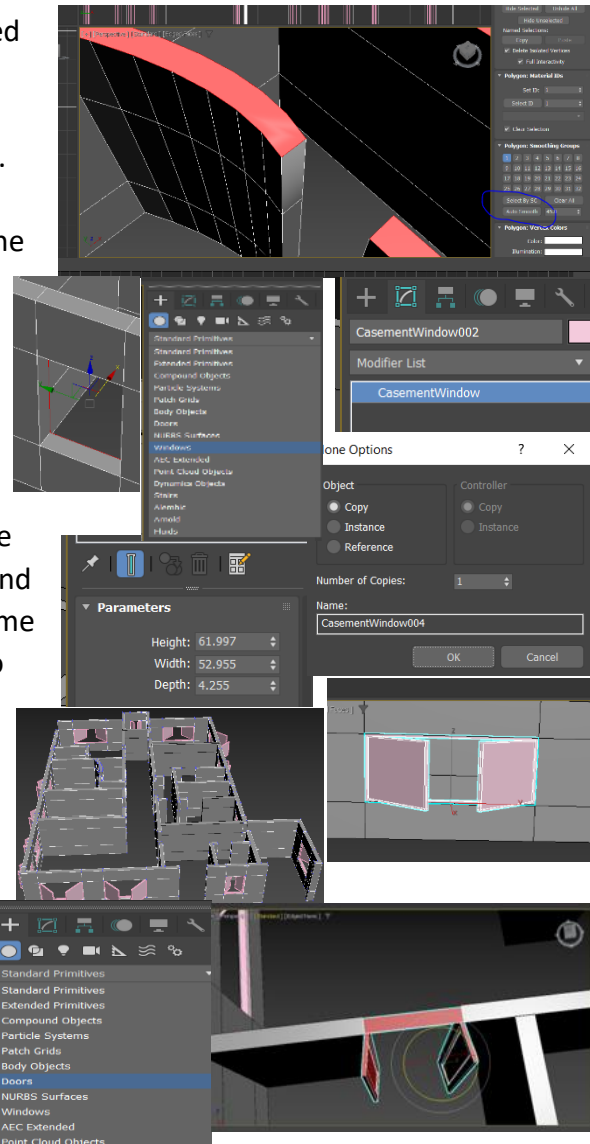

Firstly, I clicked on the **selection tool** in the option panel to select the floor plan and thereafter I went to the Command Panel's **Modify tab** which contains a variety of sub-object levels like polygon, element, vertex and border which allows for the floor plan to be edited. These tools allow for the model to be precise and accurate when designing. After which I then clicked on the polygon option. The **polygon** tool allowed me to select the flat face of the floor plan layout as a whole. I then clicked on the **extrude** tool. Extrude tool makes the model grow taller by pushing the selected model straight up or across its normal direction. I used this tool to make the model appear upward into a 3D space so it looked more realistic and easier to edit around and I extruded two times. By extruding the floor plan, it made it appear as a wall which ensured that during the continuous stages, the wall remained in a consistent thickness and kept the geometry perfectly.

Secondly, I clicked on the polygon tool to select the side of the wall and thereafter clicked on the **slice plane** tool. This tool generates a yellow line grid like a laser cutter which is placed through the entire model after which it is then sliced to create a straight line across the wall model. By performing this, it created lines on the wall which made a section of the wall that could be easily edited like a block, then using the polygon tool I clicked on the block and deleted it. This opened up a space that would be used for the window structure. I used these tools to ensure that the window section is perfectly level and accurate with the entire

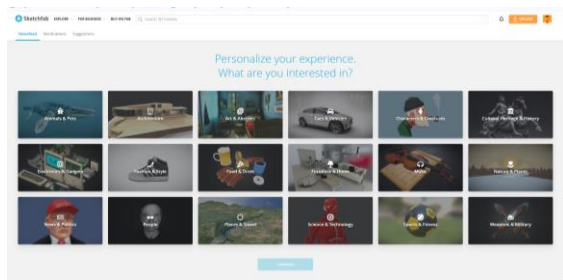

room and to also establish an opening for the window frames. However, during this process lines were generated across other segments of the wall that wasn't needed. Using the vertex tool, I was able to remove the lines and in doing so, it created odd shades on the wall which didn't match the overall look of the model. To fix this problem, I used the **auto smooth** button below in the command panel.

This button allows for the shades to be returned to its original look matching appearance of the model. Afterwards, I used the **border tool** to close the gap generated after deleting the wall. The border tool is used to select open boundaries or holes in the model. By holding the **shift key** on the keyboard, I dragged the selected border from the starting point of the hole to the ending point which bridged the hole generated. This ensured that when the window structure is placed, it has a sitting point. Afterwards, I went to Command Panel's **Object Category list** and I clicked on the window option where I chose a window type and edited its height and depth for the window frame perfectly. Using these techniques, I was able to generate the space for all areas of the room that were going to be implemented with a window. However, I kept the same height and depth of the first window and **cloned it**. By doing this, I was able to create a consistent structure for the window which also saved time in the development, but the only adjustment in the windows was its width as it was different from each room. Furthermore, when I cloned the window, I clicked **copy option** because it allowed a

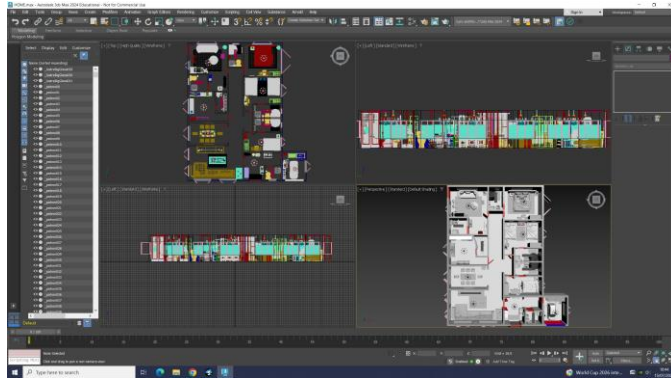

single effect to be applied on the new selected window whereas **instance** allowed the effect to be applied to the other windows which would affect width when structuring other rooms. I then clicked on the door in the object category list and applied the same effects as the windows in places where doors are placed.

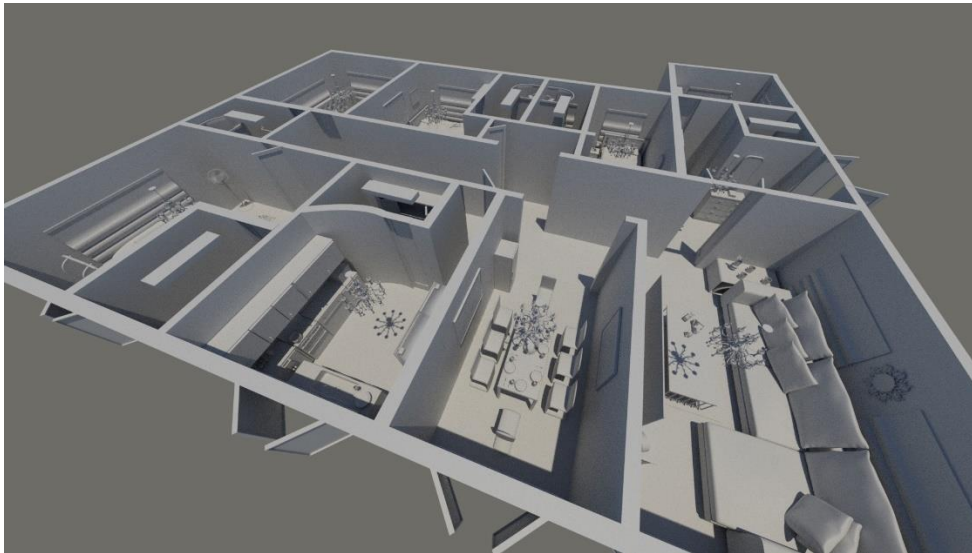

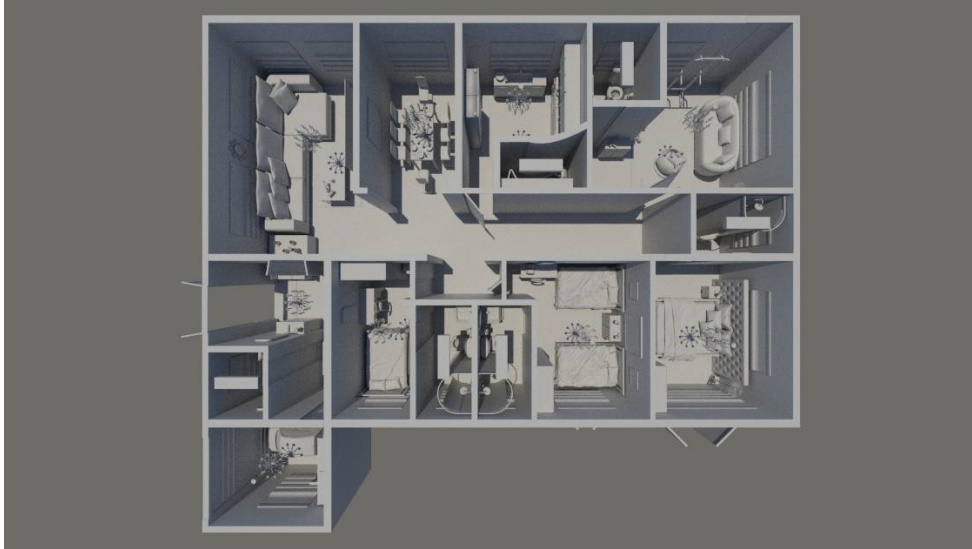

Afterwards I went onto a 3d model website to import household furniture to make it feel like a modern home. Using this furniture,

I was able to make the house model realistic and modern. This ensures that the mode is very appealing to its target audiences.

Finally, using the render tools I rendered the model. I did to make the modern appear like modern house. Rendering was really efficient as it made the model aesthetic appear professional as it made the model into a lifelike visual which was the aim of the client brief. This is the rendered model.

## Post-production Testing and feedback

I am my own client and have tasked myself with creating a 3D digital model. The purpose of the model is to **present my interest and skill in architecture**. It is also to be used in my portfolio for university and job applications. The model must **create a modern and sophisticated appearance** to its viewers **with use of simple and neutral colours**. I would like for **the model to be a modern 3D house** which incorporate key features. For example, the model should **use housewarming furniture to create an eye-catching feel**. The model should also be **aimed at future employers and university application officers**.

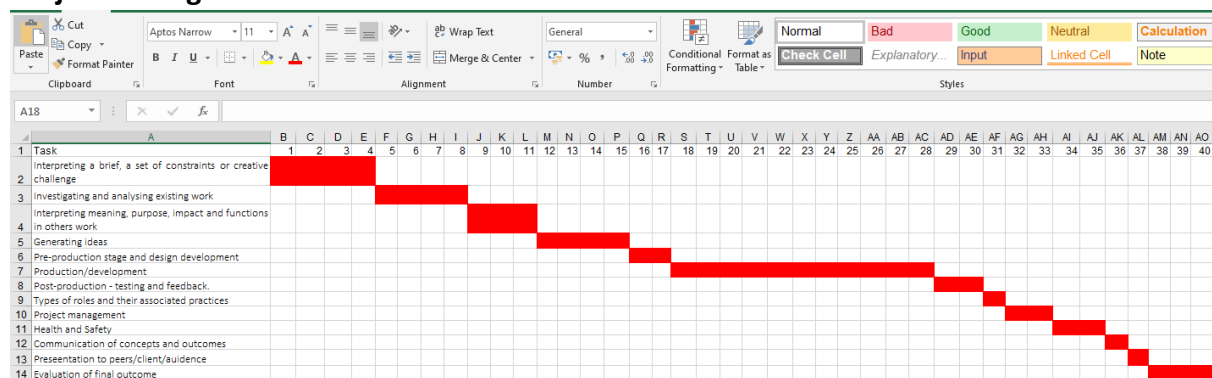

| Client's Question                                                              | Why am I asking this?                                    | Designer's answers | Implication on project                                                                                  |
|--------------------------------------------------------------------------------|----------------------------------------------------------|--------------------|---------------------------------------------------------------------------------------------------------|
| 1. Does the model have a modern and sophisticated appearance?                  | To ensure it appeals to its targeted audience.           | Yes, it does       | This indicates the project meets a premium standard and is of high quality.                             |
| 2. Does the model use simple and neutral colours?                              | To ensure the design remains in consistent layout        | Yes, it does       | This indicates that the aesthetics of the project is efficient has is not stray the viewers' attention. |
| 3. Does the model feature housewarming furniture?                              | To ensure the model provide a feeling of belonging.      | Yes, it does       | This indicates the model evokes a welcoming and inviting emotion.                                       |
| 4. Is the model aimed at future employers and university application officers? | To ensure it fit the purpose of being a portfolio piece. | Yes, it does       | This indicates the project is presentable and approvable by its target audience.                        |
| 5. Is the model eye-catching?                                                  | To ensure that the model is pleasing and engaging.       | Yes, it does       | This indicates the model has a high visual and very appealing.                                          |

## A2.4 Demonstrate professional skills and behaviours in response to a creative brief

### Types of role and their associated practices

For this project I am the client, however, I have discussed with friends and teachers to help when deciding specific windows and door types used for the model to help really capture the essence of a modern house. Their collaboration with the project helped ensure the model was at a suitable and acceptable standard, but as I am the client I gave the final decision.

### Project management

## Health and safety

For this project, I worked within the school environment. However, the only issue encountered during this project was eye strain as there was an excessive amount of time spent on the computer but whenever this occurred the solution was simply to take breaks from the project. This method was simple and effective.

| Hazard         | Risks                              | Control Measures                |
|----------------|------------------------------------|---------------------------------|
| Posture issues | Neck pain or back pain from chairs | Maintain a good sitting posture |
| Screen time    | Eye strain and headaches           | Take break every hour           |

## A2.5 Apply communication skills in response to a creative brief

### Communication of concepts and outcomes

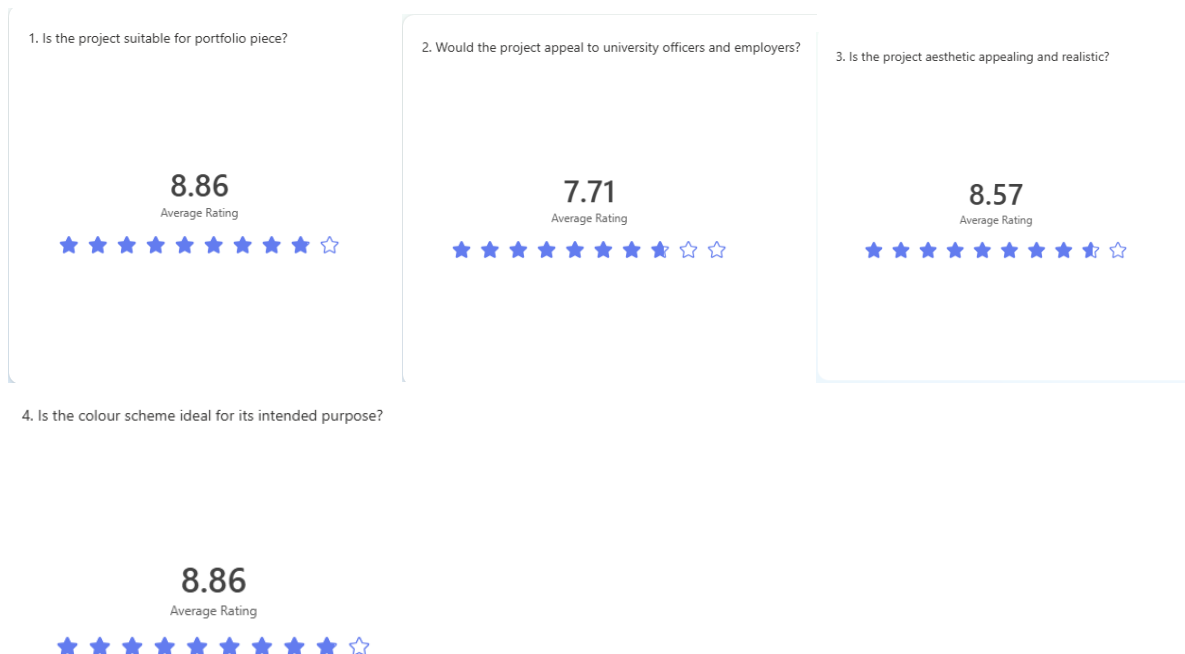

From the client brief, it is clear that the purpose of this model is presentative as it a portfolio piece. The aim was to design a 3D digital model of a modern house which was successfully achieved. The main function of the project is to showcase the client interest into the architecture field as well as his design capabilities to potentials universities or employers. The final model is very suitable as it meets it success criteria of having modern and sophisticated appearance as it was required in the client brief. Alongside this, I ensured the model contained housewarming furniture as it is clearly visible.

**Presentation to peers/client/audience**

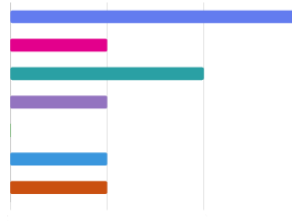

| Audience | Feedback                                                                                                   | Response                                                                                                                                      |
|----------|------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Megan    | All the colours go well together (cohesive) but I think there should be some more colourful decorations.   | From this feedback, I understand that the model colour scheme is very organised although not very colourful but could still be easily altered |
| Ross     | Floor colour should be changed to a darker colour and the bathrooms should be easier to move around.       | Looking at this feedback, I understand that the bathrooms are restrictive and lack enough space for easy movement.                            |
| James    | The design is very plain, the walls should be different colours and the art work should be more colourful. | From this feedback, I understand that I need to implement more colours to make it really pleasing to the eye.                                 |

Overall, the model is very functional, and it meets its purpose. However, slight improvement could be made on the colour scheme to really create an extraordinary look.

**Questionnaire**

5. What was the best part about my design?

- living room
- dining room
- master bedroom
- workout room
- kitchen
- bathroom
- Other

From the client response, I understand the colours is a little beige but this is a visual concept and the colours could be easily changed. The client likes the layout of the bungalow and the master bedroom structure is pleasing.

### **Evaluation of final outcome**

The design is very realistic as it makes use of simple colour to easily portray the model. The colour structure ensures that the model can easily be understood when presented to its audience. However, from the qualitative and quantitative feedback, I understand the colour scheme could incorporate more designs to make the model eye-catching. The design also features of range of room which is very ideal in a modern bungalow house which makes it suitable, appropriate and functional for a real-world application. Furthermore, the design layout of the house is very spacious as it offers quick accessibility to each room. The design is also very detailed which is makes it distinguishable and unique by making using of household furniture such as TV, Bedroom, Bathroom,

and Toys. By implementing these features, the design captures the essence of a modern and realistic bungalow.

During this project, I stuck with timescale however as production the stage got rushed towards the end, I was unable to generate a roof for the model. Going forward, I aim to make better use of the time and develop a good time management skill to ensure projects can be reviewed and improved upon within the timescale given. Furthermore, for the project I made use of 3ds Max to generate the model efficiently. The software was outstanding as it provided a range of capabilities. For example, the software allowed for the model to be rendered upon completions and the tools are quite easy to understand which made the designing of the model a lot easier.

When the model was completed, it was presented to the client through a PowerPoint presentation highlighting all the keys stages, including research into existing products, initial design concepts sketch and production stage. This ensured the client got a full understanding of every step taken to achieve the final design.

Finally, in the client brief, it stated to create a model that is “modern and has a sophisticated appearance” which was met and the reviews from the peers and audiences highly indicated the model was distinct and aesthetic. The goal was a design a portfolio piece which was successfully met with the aid of research and reviews.
