

A1.1 Informing ideas

The purposes of 2D digital graphics for different platforms

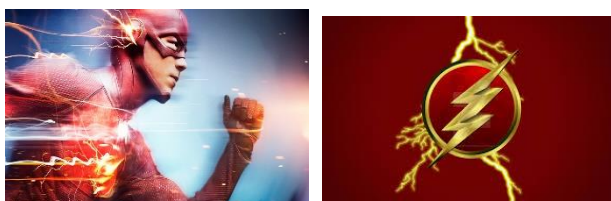

Designers add graphics to their documents to give an comprehensive visual presentation about a particular topic. For example, graphics are used in educational system to help educate students. This is seen in a textbook where an image elaborates a topic easier than having to read over 2pages worth of notes. Designers use graphics because it makes a topic easily understood through the visual aid provided by such graphics on a document. For examples, research data often contain detailed percentage data, but with use of a digital graphics it makes easily comprehensible and more convenient. i.e. this image shows the percentage of items that are bought which is a lot easier to understand than reading an essay about it. Graphic isn't only used for educational purpose but used in entertainment and branding company. Graphics makes documents more engaging and interactive.

Graphics have a few main uses and they are:

Educate – graphics are used in academic institution for better learning of a topic or subjects. Graphics makes it possible for student to easily understand concepts by giving a better visual understanding. It makes the topic much eye-catching which helps the students engage more in the topic as the images/graphics has broken down the topic in a more convenient order. For example, the image shows how graphics is used to illustrate a topic.

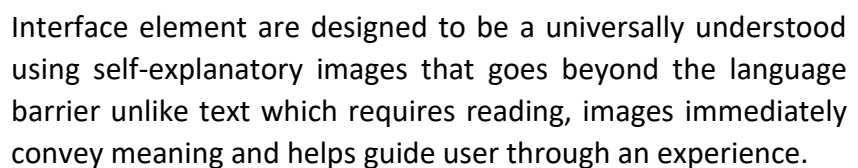

Entertain - graphics are used to make products more enjoyable. It does this by creating visually appealing images which captures the eyes of the audience. For examples, when planning to make a movie/films, the use of graphics needs to be considered largely to make the movies entertaining.

Inform – Infographics gives a visual representation of data in the form of images which makes presentation in a meeting more consequential and meaningful. In a financing meeting, infographics are used to display lots of data which is then easily understood. They enable decision makers to quickly identify problems and solution and draw summary without having to go through pages of numbers

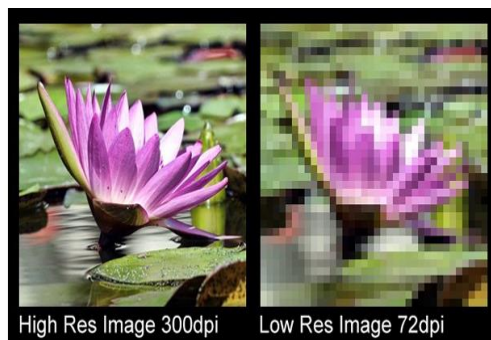

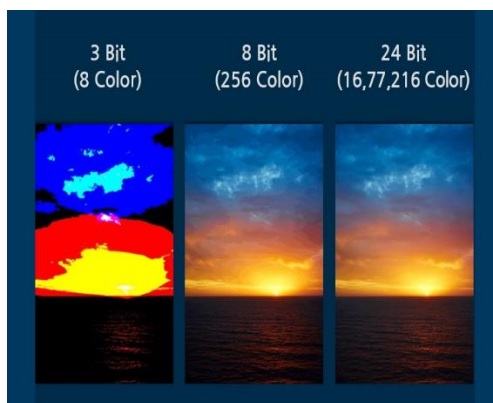

A screenshot from the game showing the character Ryden in a combat stance. Ryden is a young man with brown hair, wearing a green jacket and black shorts. He is holding a glowing blue energy shield. In the background, there is a large, dark, industrial-looking structure. A banner at the bottom of the screen reads "NEW CHARACTER RYDEN".

Comparing and evaluating the different uses of digital graphics

Digital graphic has many different purposes to reach its target audience which includes educating, entertaining and informative purposes. Digital graphics used in the gaming industries need to have a good visual quality but it will therefore mean that the loading time for such games will be slower. Although they can be fitted to have a decent visual quality which means that the loading times will be a little faster. In print publishing, the visual can have high quality as it is not seen on a screen but published on papers such as magazines and newspaper.

Digital graphics must be checked against technical constraints. Technical constraints in digital graphics are limitations on project or platform. Examples of such constraints are file sizes, image resolution and image formats. A graphic designer needs to consider what file formats and properties are needed when creating the graphic, or when designing the project or platform. For example, in print publishing the limitation that influences design are paper properties and materials quantities such as ink resolution. Publishers will need to ensure that there is a consistency in the developments of such projects. The graphic designer will have to ensure the images have a high image resolution and high colour depth. Having a high image resolution will ensure that the image is smooth and not blurry unlike having a low image resolution which will cause the image to be blurry which does not make the graphic design appealing to its audience. Furthermore, having a high colour depth gives the publication a well-defined and professional graphic design unlike having a low colour depth which makes the design less realistic. Moreover, graphic design used on the internet will need to have a lower image resolution as it creates smaller file sizes which allow images to load faster and improve graphic features. An ideal usage of lower image resolution would be on websites, games and social media. Another major

factor that needs to be considered will be the colour depth. The colour depth would need to be low as it also reduces image file size which helps load documents faster.

Explore the use of digital graphics tools & techniques for specific media purposes

There are different types of graphic file format that are used to store digital images. There are two main types of graphic file formats which are Raster and Vector.

Raster

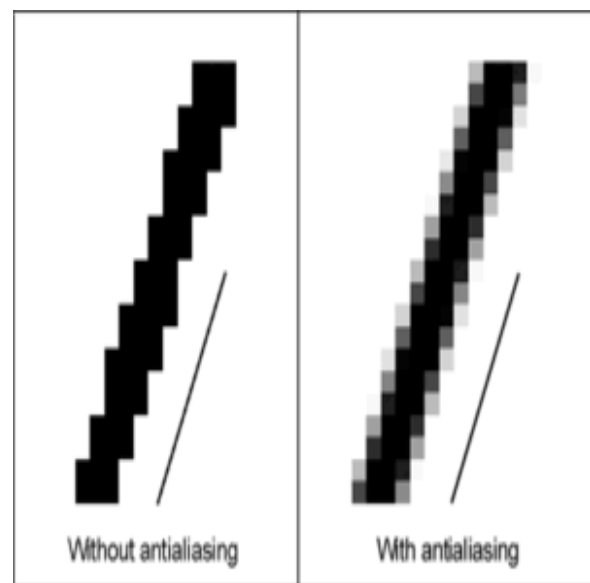

Raster graphics are images made of a grid of individual pixels with each pixel containing its colour information. They are great for detailed images although can be really blurry when sized or zoomed in. Some of its key characteristics are that such images are resolution dependent which means that the quality of the image is based on its resolution. One of the key characteristics of using raster graphics is that it is exceptional in capturing incredible details for images and photographs. Examples of raster graphics are JPEG, PNG and GIF.

Vectors

Vector graphics are digital images made from mathematic equation that defines points, rather than using individual pixels. This allow vector graphics to be adaptable to any size. It makes them useful for designing logos and creating illustrations. They are useful for creating web and app interface due to its scalability. Examples of vector graphics are company logos and billboards, etc.

Image compression

Graphic image is needed to be compressed so that they can reduce file sizes which makes them load faster on websites that uses less storage and improves the overall performance of websites. There are two types of image compression which are lossy compression and lossless compression. Lossy compression reduces the file size of graphics by fully removing some of the graphics original data thereby leading to smaller file sizes. However lossless compression reduces the file size without losing any of its original data. A graphic designer would use lossy compression when making smaller files sizes for downloading and sharing data fidelity whereas using a lossless compression when it is essential to maintain the data fidelity.

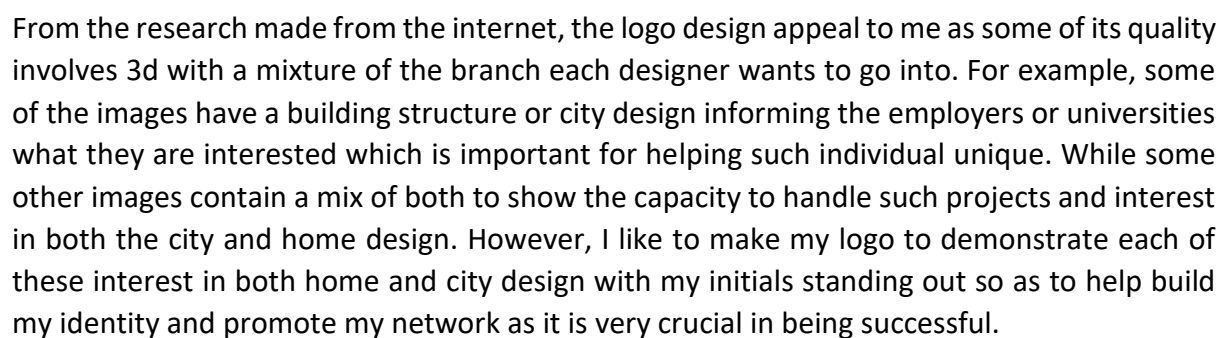

Data fidelity: accuracy, consistency and reliability of data throughout its life span.

A1.2 Explore and develop problem solving skills

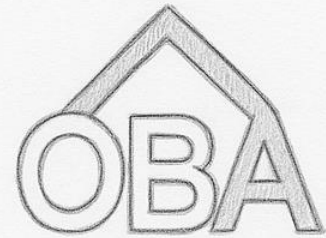

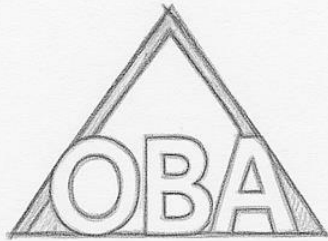

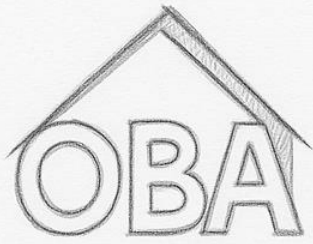

Client Brief

I will be creating a logo for myself as an individual who is interested in the architectural industries for home and city design. The main purpose of this logo will be to create a clear brand and identity myself as an artistic architecture student. To be able to do this, my logo will need to stand out and be recognisable as it will display features of artistic home design. My logo will be created using my initials and combination of graphic icons. I will use a variety of colour to design my logo such as red, yellow, orange and green if possible. The brand values I want my logo to represent would be simple but sophisticated. These colours represent my passion, energy, creativity, and balanced approach to design solutions. The logo will be used on both digital and printed platform; on my website and on printed documents like my cv and portfolio. The logo will be created as a vector file so it can be resized to fit on any size document therefore I will need to provide a resolution that suits both printable and digital version. I will adopt a unique house style. The target audience this logo will need to appeal to is universities and future employers who will see it during in application and interviews. I will be making the logo by including my initials, O.B.A

Developing concepts and generating ideas

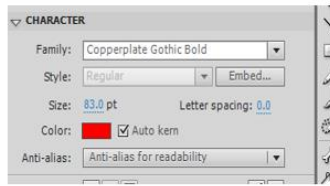

Pre-production

After doing some research ideas on what I want logo to look like I have concluded with this sketch. I went on the internet to research some logo designs with the initials OBA so I could decide and get a variety of logo designs and after I concluded on four image which caught my eye. Then I went unto using those images to create sketches of logos design and I concluded on the images above.

Production/development

After finalizing my initial logo sketches, I went ahead to Adobe Flash

Professional CS6, a design software to make a better-looking version of the logo.

Firstly, I imported my logo designs into

the software and used the line tool to trace the components of the logo, applying a consistent stroke for accuracy and precision. For the text aspect, I used the text tool to search for a font style that closely related to the one in my original logo designs. Once I found a fitting font, I adjusted the font size to achieve the correct length for the logo. I then arranged the letters side by side allowing me to modify specific segments to better unite them with the overall design. Afterwards, I aligned the logo components using the snapping tools to maintain balance and consistency. Finally, I traced the curved segment in the original sketch and incorporated it perfectly into the logo completing the design.

I used Adobe Flash Professional CS6 to create the logo designs because in the client brief I claimed I will create my logo design as a vector which the software used. It was very beneficiary.

Afterwards, I realised that the whole logo would be unable to appear on the website home page, so I went ahead and edited out the building aspects of the design so it could fit at the top right corner of the webpage. I then added the desired colours to logo designs using photoshop.

Post-production - testing and feedback.

To be able to do this, my logo will need to stand out and recognisable as it will display features of artistic home design. My logo will be created using my initials. I will use a variety of colour to design my logo such as red, yellow, orange and green if possible. The logo will be used on both digital and printed platform; on website and on printed documents. The logo will be created as a vector file. I will adopt a unique house style. The target audience this logo will need to appeal to universities and future employers.

Client's Question	Why am I asking this?	Designer's answer	Implication on project
1. Does it appeal to universities and future employers?	Because it gives clarity on whether it appeal to its audience.	Yes, it does	It shows design awareness and professionalism.
2. Does the logo display artistic home design?	Because it is essential in identifying the brand.	Yes, it does.	Improves branding identity
3. Was the logo created using my initials?	Because it gives the client their reputation/identity.	Yes, it was	Improves reputation and name. It helps with being known such field.
4. Did you use a variety of the colours requested?	To give a better aesthetics to logo design	No, as it made the logo unprofessional.	There will need to be a colour to represent the logo which the client really wants.
5. Is it viewable on both digital and printed platforms?	Because it must be accessible to all(inclusivity)	Yes, it is	Accessible to all.
6. Was it created as a vector file	Because it must be accessible on all electronic devices.	Yes, it was	Viewed on all devices.
7. Does it have a unique house style?	Because it needs to stand out in its field.	No, as it is very common within the architecture world.	It does not stand out too well in its field.

In accordance to the brief, the logo design is recognisable but it does not stand out as it is very common in its field. The logo design does display artistic home design and it was created using the client initials. Although there is a conflict whether to use colour as it makes the logo artistic and not professional but solution is being brought to the matter. The logo is indeed viewable on digital and printed platforms as it is created as a vector file. However, it does not have a unique house style. However, the logo does fit it purpose as it meets the client brief effectively although it lacks the colour palette intended which solution is being brought to.

Client request: can you please add a desirable colour scheme that will suit the purpose of the logo.

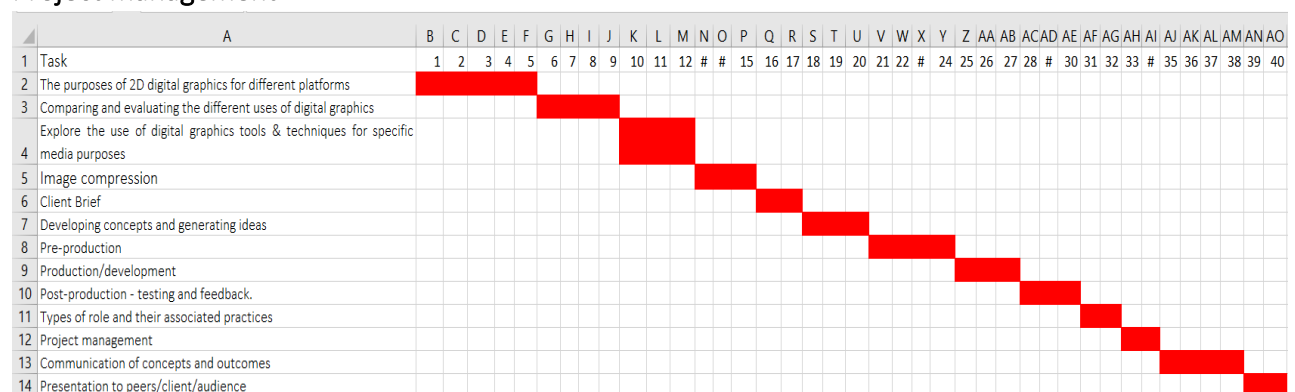

After some reviews on the logo, the client has decided to add a colour scheme that appeals more professional than to a creative artistic tone. The client decided to go for a gold/yellow scheme. For this to be done quite perfectly, the logo was exported from adobe flash as a

The collage features several Photoshop interface elements:

- Top Left:** A text field with the name "logo design - Picture" and a file type dropdown set to "PNG (*.png)".
- Top Right:** A toolbar showing the Gradient Tool, Paint Bucket Tool, and 3D Material Drop Tool, all with a 'G' icon.
- Middle Left:** A color picker showing a yellow color with the hex code "#e7c250" and the RGB code "rgba(231, 194, 82, 1)".
- Middle Right:** A toolbar showing the Lasso Tool, Polygonal Lasso Tool, and Magnetic Lasso Tool, all with an 'L' icon.
- Bottom Right:** A color picker showing the hex code "#000000".

Text overlays on the collage include:

- "ne" (part of "name")
- "as type:" (part of "file type")
- "the hex numbers in adobe" (part of "the hex numbers in adobe color picker")
- "the gradient to find the right" (part of "the gradient to find the right color")

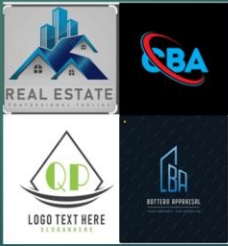

This is a board showcasing the all the task I did within the 40hours duration. The red colours represent the hours I spent on each section. The more the red colours in section the longer I spent on each section.

A1.5 Presentation and review of final product

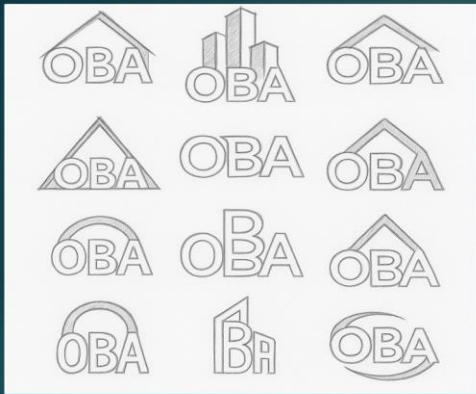

Communication of concepts and outcomes

These are images gathered across the web in order to get inspiration on designing a logo for my client. As you can see there is a range of logo designs which really helped in deciding what ways I should go about designing the logo. Some of the log really appealed to and that it why I selected the ones which most appealed to audience and fit its purpose. These images are displayed below.

These images really appealed to its audience and really fitted its purpose and they inspired me to generate my early sketches on the logo I was going to design.

These are some of the logo designs sketches I made and thereafter went on to creating a more sophisticated logo designs. Although drawing those sketches took a lot of time, it edged me in creating better logo designs.

These are the other logo designs I created after making the initial designs. They really suited my client brief which led to choosing two of the designs that suited.

I decided on creating the logo using this two images; the building concepts from image 1 and the text and style concepts from image 2. I felt they both stood out and were unique.

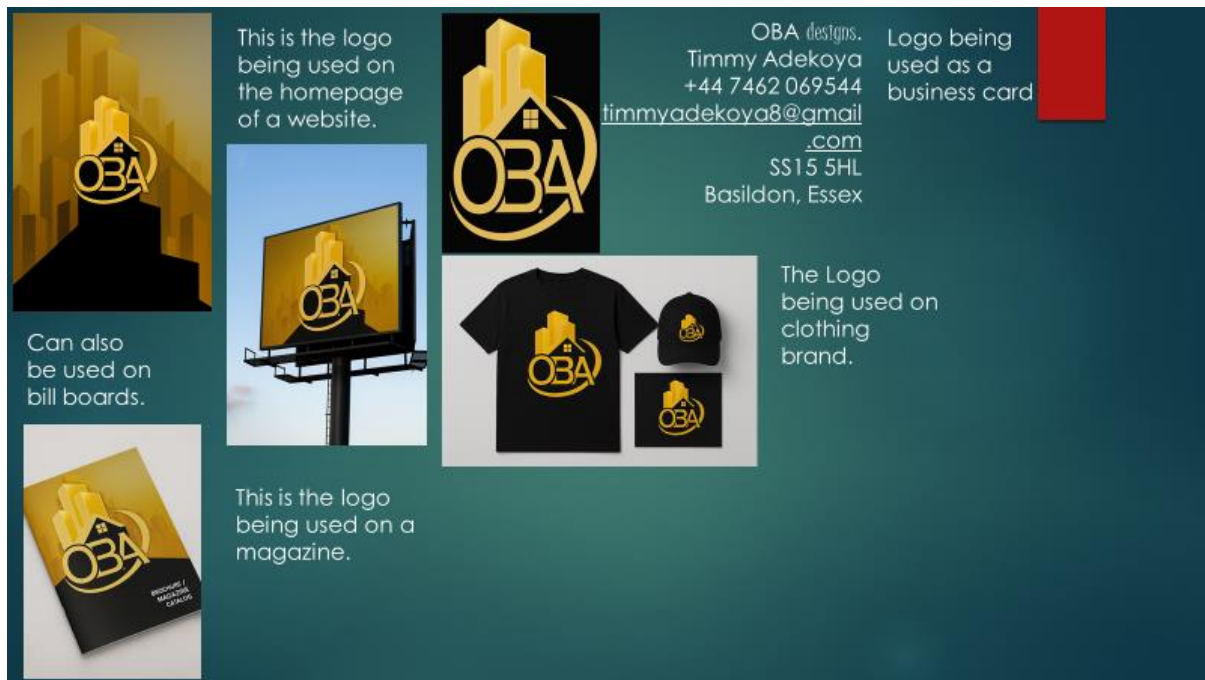

Afterwards I went to Adobe Flash and using the tools on the software I created a unique logo design which I later went onto a different software to make improvement.

This is the logo I created using my logo design sketches.

Afterwards I took the logo design to another software called Adobe Photoshop to create a better colour scheme for logo.

I have chosen to show the logo in use on website because it helps create branding identity for the client, I also show this because most digital platforms have a unique logo that helps them be recognised especially in this technological and digitised era. It also fosters trusts with the users on the website.

I have also chosen this logo to be used on magazine, brochure etc (printed platforms) so that it can be accessible to all people.

The logo is created as a personal brand for the client to showcase his skills and work. The logo was designed to display the client desire to be an architect as it does show these qualities. The logo will be presented on a website designed for their personal use. It will contain their cv and portfolio.

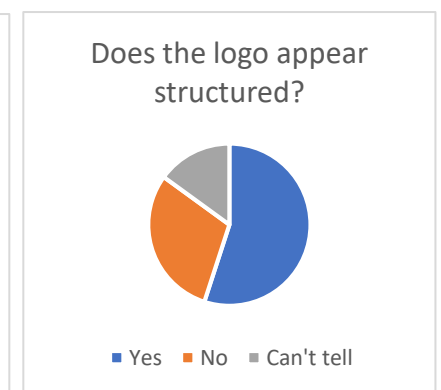

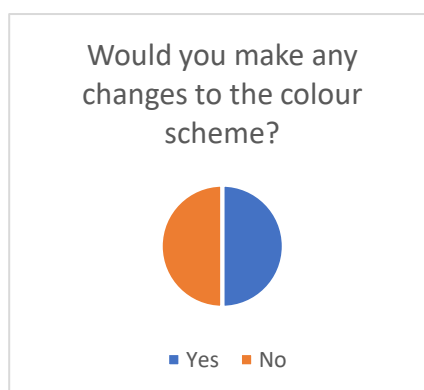

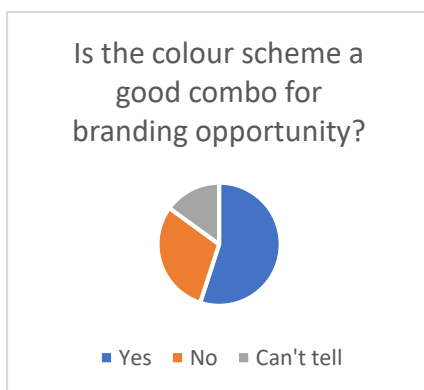

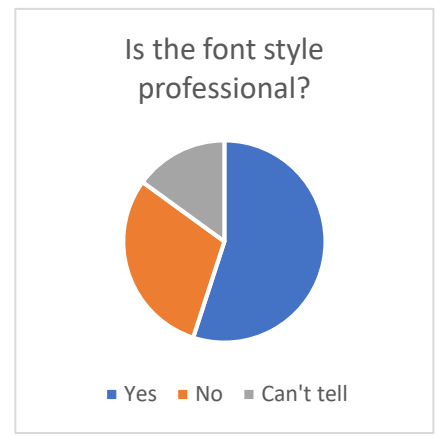

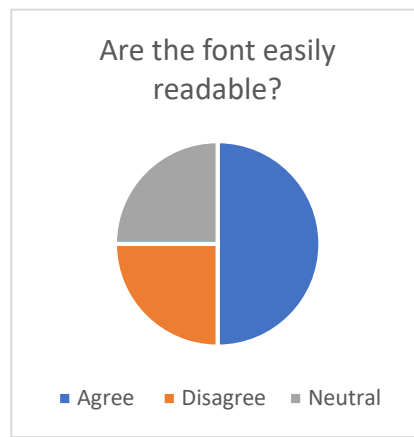

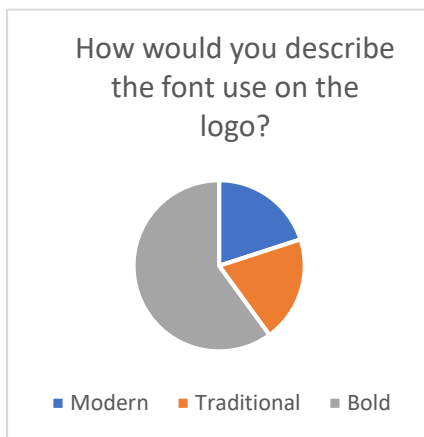

Presentation to peers/client/audience

Audience	Feedback	Response
Mrs Curd	I really like the strong graphical images you have used in the logo to represent the house and skyscrapers. The impression you are giving is a seamless transition from housing design to metropolitan design. The initials have been created using a bold presentation and the 'swish' nicely encloses the bottom of the logo. The skyscrapers seem to rise from the initials in a metaphorical	From the feedback gotten from Mrs Curd, I would say overall that the logo design is authentic and unique which gives the professionalism given from the logo. However, there is ongoing possibility to improve the colour palette on the design.

	way. The colour palette is limited but the impression created is one of luxury and expense, given the yellows and golds used. There is a look of professionalism to the design. Your diversion from the brief, not including the reds, oranges and greens, was a sensible decision and the black background complements the design.	
Mr Vano	Your logo has a very strong architectural theme, and this is well integrated into the typography you have developed. In fact, I think the typography, and the manner in which you have combined and modified letter shapes is a real strength of your design. It is unique and will serve to make your design very memorable and easy to recognise. This will certainly help you establish your brand visibility. You have selected highly contrasting colours that will make your design highly visible.	From the feedback gotten from Mr Vano, I would say that the logo design has met its design specification although there is a possible chance of improvement.
Kai	The logo fits the approach of trying to be bold and prevalent, making it very recognisable. He said he would use a variety of colours like red, yellow, orange and green but only used black and gold, so I believe that description must be changed. And instead of representing passion, energy, creativity and balance it instead can represent power and	From the feedback gotten from my colleague, I would say that the logo meets the design specification except in the area of the colour scheme.

	presence in the architectural scene. His initials make it well known whom is bringing this approach and who to come to. I believe the logo to be a good, simple approach, but if he wishes to adopt a “unique style”, I believe the logo might help to represent this.	
Alex	The logo is bold with clear outlines and highlights the points stated in the brief when referring to the architectural elements and the colour scheme even if there is some slight deviation from the original brief colour pallet.	From the feedback gotten from my colleague, I would say that the changes made regarding the colours were necessary for the better improvement of the logo.
