A1.1 Informing ideas

Explain the common design trends that websites use.

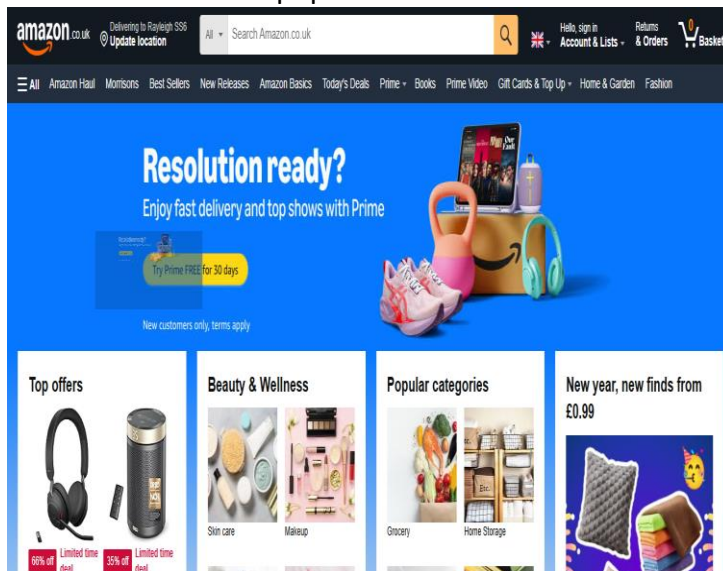

Instagram is a well-known website internationally. It is a website where people can watch entertaining videos. The website follows some common design trends such as position of some elements within the web page. For example, a header at the top left corner of the page

where the logo is placed. This helps to establish brand identity for the organization. Afterwards there is a search tool that allows you to find people across the world such as celebrities and inspirations like Dwayne Johnson and Kevin Hart alongside Cristiano Ronaldo. The tool/bar is placed across the upper middle section of the

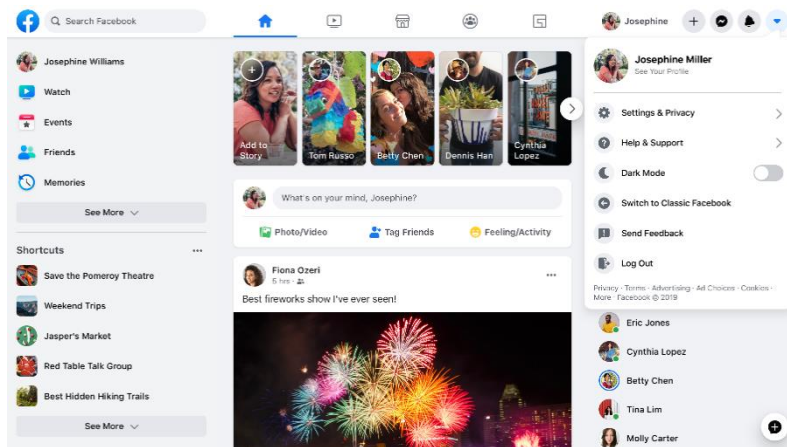

website. Furthermore, at the top right corner of the website, there is notification and message icons like a bell or inbox icon which allows you to see notifications and messages from friends and other users which enables user interaction. There is usually a profile section either on the right or left side of the website beneath the header or the menu bar. Underneath this is a content feed; a range of videos relating to one's personal interest or popular videos that are currently trending like the 6'7 trend.

Amazon is another popular website in the UK. It is an ecommerce website used to sell

products like portable fans and juicers. The logo is placed on the top left corner on the webpage as most websites do which is a common design trend. Right across the top middle is search bar used to search products and at the top right corner of the page is a cart icon. This is a different setup to other websites as its purpose is for ecommerce. The tool navigates you to the order you placed to review the item and underneath this top section is a subsection

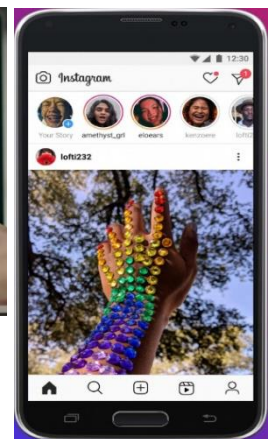

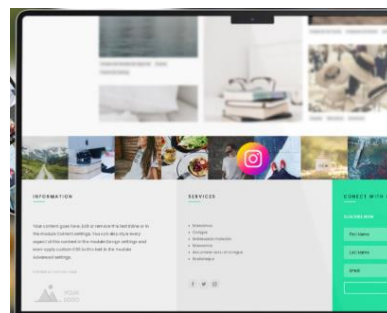

which has a range of categories like popular deals. Furthermore, under all this is a large display of products that can be bought with their prices.

Facebook is also an international website. It is a multipurpose website: entertainment and commercial. The header has the same positioning as other websites, a common design trend. The menu bar is placed differently on Facebook next to the header to make it clear and apparent. The content

feed is very similar to Instagram as it is for entertainment. Most websites use 1-2 main colours for their webpage which you can see across all three websites displayed.

All websites have a footer which is found at the very bottom of the webpage. It often contains copyright text, help or policy

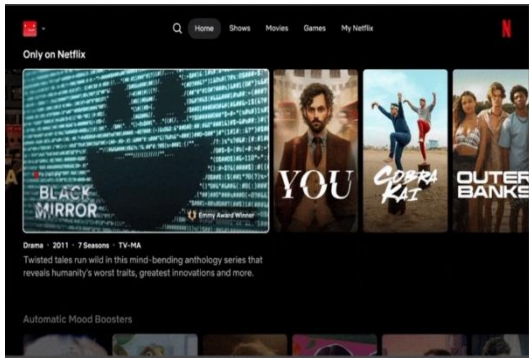

links and company info. Another ability website have is to access the size of the screen and then resize the website to fit the screen like on a mobile phone or other devices. All or most websites have a similar position of the header and tends to use one to two colours for the webpage.

When comparing all websites, it is clear that while they follow common design trends such as positioning of the header in the top corner and colour schemes, their design layout usually differs depending on their purpose and audience. For example, social media websites layout is different to ecommerce websites such as their content feed where Instagram focuses on continuous user engagement whereas amazon prioritises purchasing displays.

Give examples of common codes & conventions.

Find examples of websites that have specific purposes, and describe the common design trends and elements included.

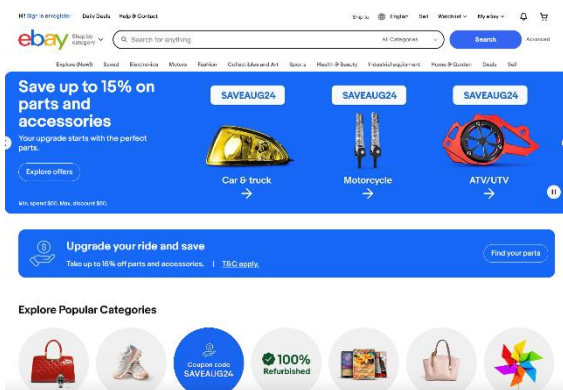

- **Entertainment - YouTube, Netflix**

Entertainment websites features content to engage the user and increase user interaction. The contents tend to contains videos for the audience. The contents are filtered to each individual preference. On some entertainment website there is usually a comment section where the audience give their opinions on the entertaining service and also a like or dislike button to show their satisfaction with the content. These websites allow

the users to share such content with their friends. All of these features are designed to ensure the sites are user-friendly to everyone. The goal is to ensure the users stay entertained and enjoy the content.

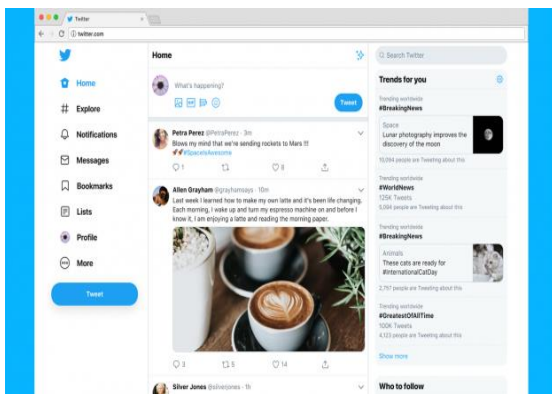

- **eCommerce - ebay/amazon (buy and sell)**

Ecommerce websites features content that allows users to buy and sell items online which is the main purpose of the websites. It features a search bar at the middle centre of the webpage for easy accessibility and navigation. This allows the user to search for specific products and add to their basket. Basket icons are commonly found on such websites to help the user monitor their purchase such as on eBay.

The website security is essential for users because they share financial information. These websites use a secure HTTPS connection which uses an encryption which protects any data sent between the user's device and eBay servers. As a result, no one can steal bank details or passwords reducing the risk of fraud. The website also features a customer review. This help build trust between buyers and sellers. It helps increase engagement through the feedback and ratings on the experience.

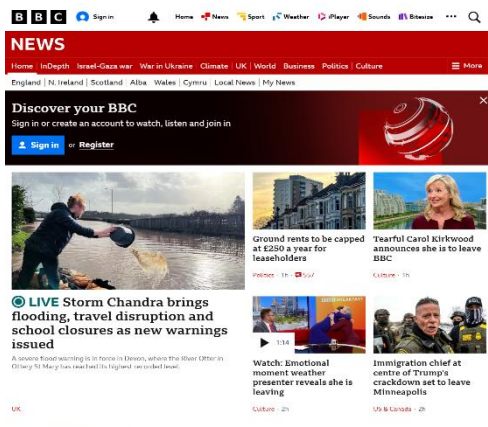

- **Social media site - facebook/Instagram/twitter**

Social media websites are mainly used to interact and engage with people. Common design trends such as messaging, video calls and live streaming keep users absorbed and interactive with content increasing engagement. Social media sites use like, comment and share buttons. They allow users to express opinions making them engaged which increases interaction with the website. The websites encourage user engagement. For example, on twitter, users can

reply to tweets, retweet content and like posts which keeps them active. One other use for social media websites is advertising. Businesses use social media sites to advertise and promote products to targeted audiences.

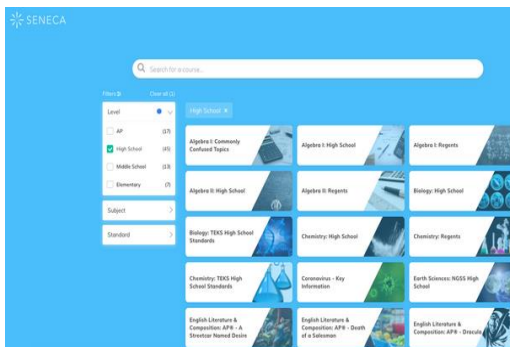

- Information sites - news site – (BBC News/sky news/educational site like bitesize)

These websites focus on giving information to the general audience like BBC News and BBC Bitesize. The sites mainly use text format to present their content. They provide users with reliable information. They use a clear visual layout to make information easy to read and understand. Common design features include headings, subheadings and search bars. Search bars allow smooth accessibility to specific topics. Headings and subheadings help organise content and enhance readability. They tend to have less images to reduce distractions so users

can focus on the information. The sole purpose is to allow users to access credible information in an easy, user-friendly way. For example, on BBC News, articles often use a brief summary at the top which illustrates the main points of the article. These websites are also used in educational institutions to help students learn such as Gizmo and Cousera.

Compare the interactive features of 2 websites with the same purpose.

Seneca and Sky news are both informational websites that provide users with information but Seneca provides information while its main purpose is to educate whereas sky news is purely informational. One design feature that both websites follow is the implementation of a search bar. This feature allows its users to find specific topics within the sites. When looking at the image, it is clear that they have a very different layout such as the positioning of the search bar. On Seneca it is placed at the centre whereas on sky news it is positioned at the top right corner of the webpage. The positioning allows quick accessibility which is clearly illustrated on Seneca while on sky news would be less noticeable as it is placed at the top. The positioning on Seneca suits the audience since it reduces the effort and helps them access information because it is visually portrayed easily while sky news focuses on headlines and breaking news which is centred at the page because the audience wants the latest and important information, therefore the search bar is positioned elsewhere as it is not the main focus. The websites are targeted to different age groups which affect how the design layout is done. For example, on Seneca, the text information is written in simple, clear text fonts for students while Sky news uses diverse text fonts because it is for the general public and for emphasis. The content on Seneca is very different as it contains courses and quizzes while sky news contents include live updates and news articles. These websites inform in very different ways.

However, both websites use videos and images, this helps their audience to achieve a greater depth of the topic. This design choice improves user engagement and interaction for the target audience.

Evaluate how effective the use these codes, conventions & interactive features are in appealing to a specific audience and achieve a specific purpose.

Interactive features are elements used by websites to foster experience for the users and website author. Common examples of interactive features include buttons, links, real-time feedback, forms and navigation bars. On websites such as gizmo or twitch, the interactive features are quizzes, videos, like buttons and comment sections. Like buttons allow users to give instant feedback which helps the authors identify issues and boosts functionality. The features are particularly different because they are for different audiences and for specific purposes because websites have different uses. For example, educational websites use quizzes because the target audience are students while social media website uses like buttons and comment sections because the aim is to ensure engagement and retention to the site. These features make the experience feel more personal and increase participation within the website.

Website authors use these features to receive feedback about the user experience and identify what could be improved. It is also used to improve interaction with the content, making the website more efficient and generally more enjoyable. Websites use interactive features to boost engagement and help web authors improve the website. As a result, website authors can tailor the content to their user preferences

A1.2 Explore and develop problem solving skills

Client Brief

I am my own client and I will be creating a portfolio website for my personal use. I want the website to feature a variety of pages to present my portfolio. The website will be targeted at employers and university application officers both male and female so it must also include my CV.

This website is for informing people about my skills, work experience and education. Each page on the website could showcase a different aspect of my profile, a section that displays my creative media skills and portfolio, a different section that also highlights my product design skills and portfolio, a section containing my contact information and another section exhibiting my work experience and CV.

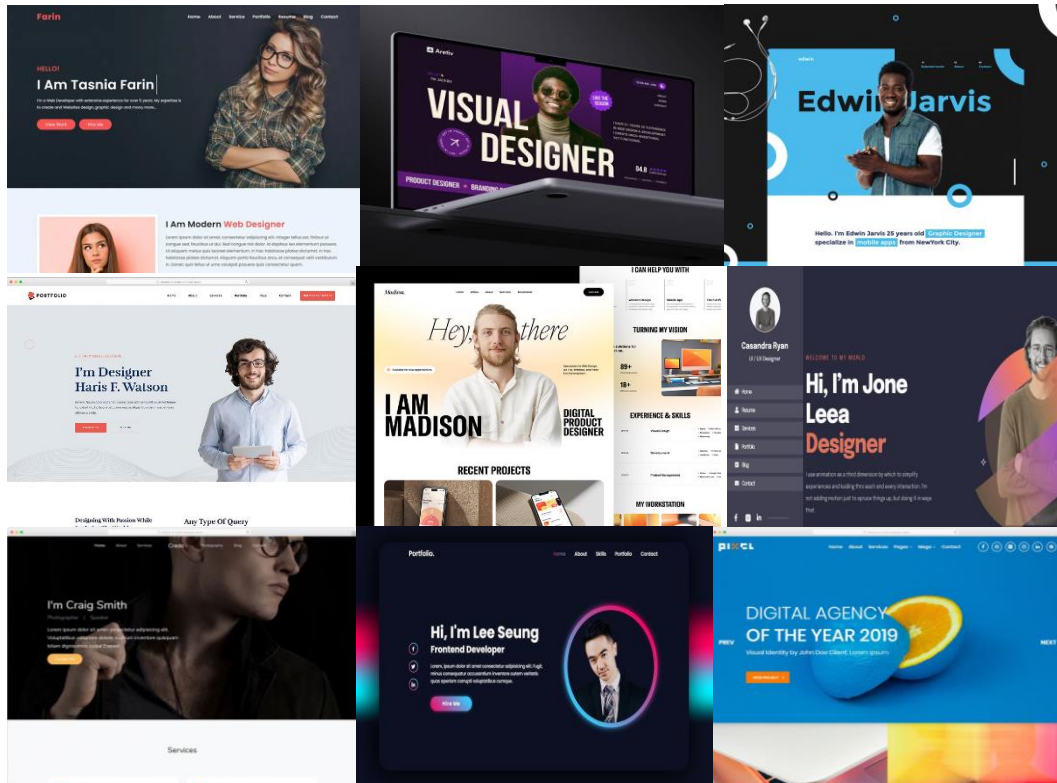

I would like the website to feature a gold and black colour because that is the colour of my logo brand. This colour is to make the website look luxurious and present a professional appearance. The website must have a high professional standard, as it is aimed at future employers and university application officers.

The website will contain a small amount of text to describe page content and it will also use a variety of images as it will showcase my portfolio. On the website, the logo should be on the top left corner of the page. In terms of the functionality, the website should be able to run

smoothly without any issues. Overall, the website will be informative to the user while promoting my reputation.

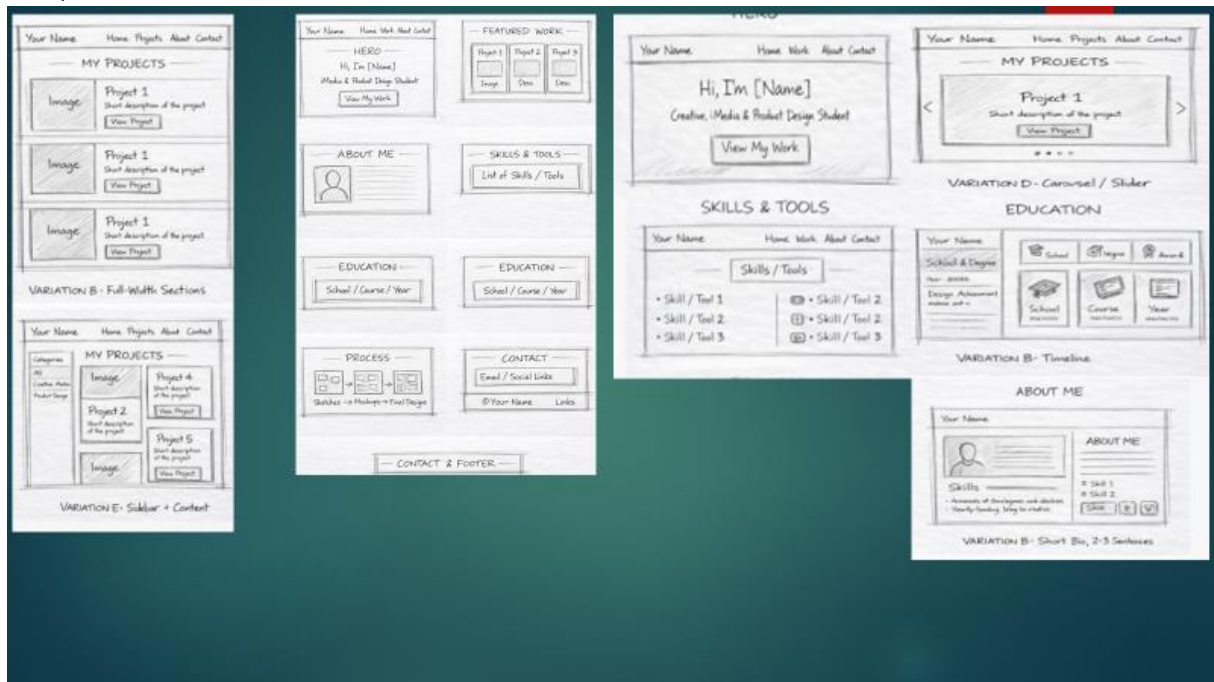

A1.3 Develop creative technical skills

Developing concepts and generating ideas

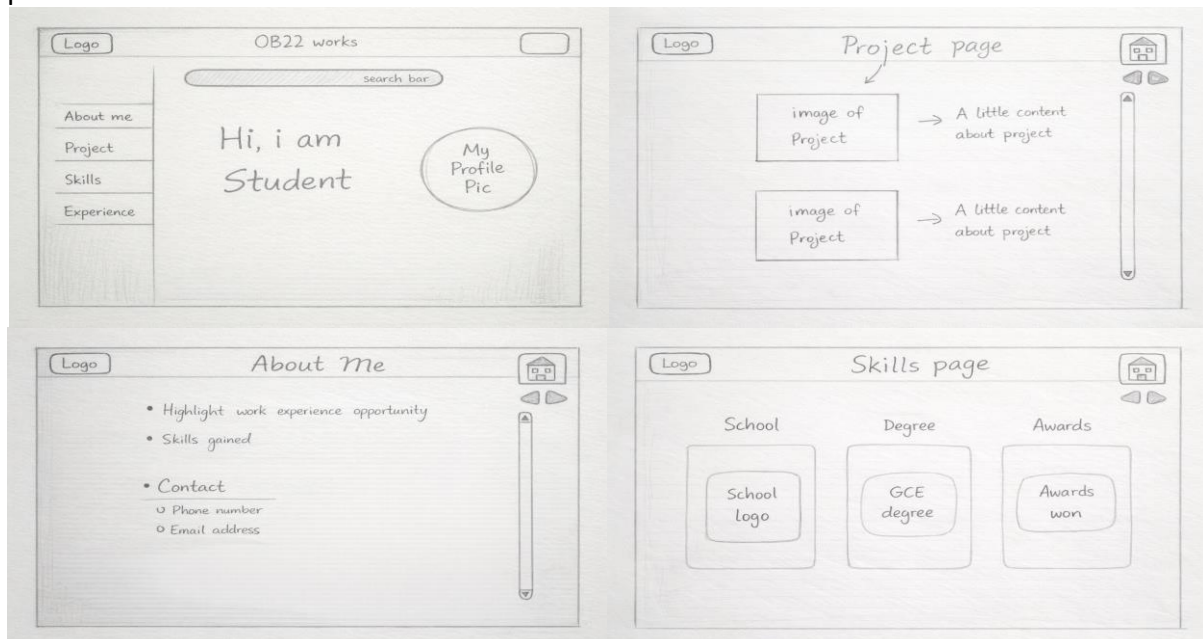

This is a moodboard of websites page relating to portfolio website. I have researched this to give me insight on how to design my website. A common design trend the websites showcase is the placing of individual profile on the homepage of the website which is good for reputation and helps builds trust. Another feature they follow is the positioning of the header which I will be implementing in the design. On each website, the designers use two to three colours for presentation of the website for consistency. The websites design feels calm and approachable and has a clear visual hierarchy. These design choices will influence the portfolio website to make it more presentable.

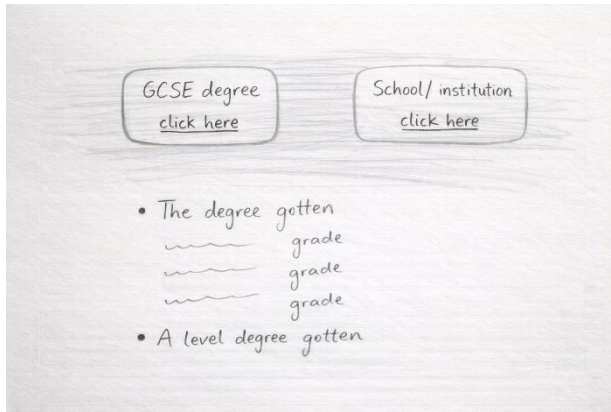

Pre-production

This is a visualisation diagram of what I would love for the website to look like. In this image, the drawings are variations of ideas that could be implemented in its section page. The reason behind this

is that in production of the website I would love to see which variations give more of a professional and user-friendly welcoming. For example, one of the project pages uses an image and short description of the projects while on another it uses an image as the main background and then a navigation button to view the work in full detail if necessary and it is presented like a slide show. The reason behind this is to also see what fit best.

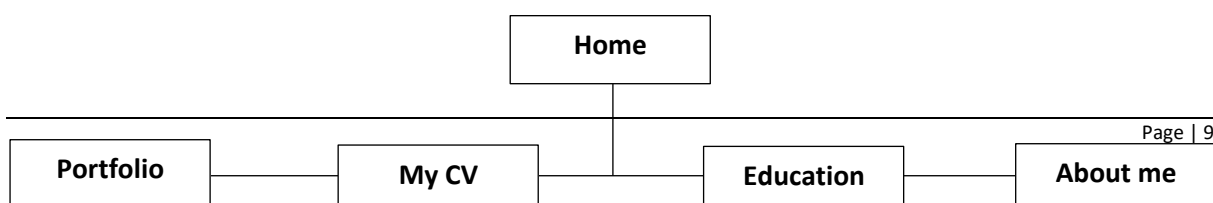

This is another visualisation diagram. This was the first idea that I created and the whole design is very interactive. For example, the header that displays the home button isn't just for aesthetics, as I would love for it to be interactive. The logo is placed on the website to promote the brand and reputation. It was positioned in such a way as it is a common design trend which I implemented into the diagram. On the homepage, I placed a search bar tool so that each section can be easily accessed even just with spelling of the first word like 'c' for contact. I then went ahead to add a profile picture because most portfolio websites use this design trend but am not decided. Towards the left-hand side of the homepage is a sidebar navigation panel that displays all the contents on the website for easy accessibility. I added this feature for efficient manoeuvre around the webpage and to reduce confusion upon accessing the webpage and it is also a common design trend which improves usability. On the project page, the design isn't the finalised idea as I have earlier mentioned there are variations that needs to be tried out too see what fits bet and this is just an example. Moving unto to the skills page, I categorised into sections that is clearly seen. Each segment will have navigation. For example, the degree segment has a '**click here**' navigation that shows the degree I have obtained. But is its mostly likely the case it will change to '**education page**' and not skills page. For the last section, '**about me**' this section will portray my contact details and work experience like a CV section as it is a portfolio website. In this visualisation diagram, I implemented a lot of interactive feature like the vertical scrollbar and arrow buttons. I placed them to easily access each page with a single click. This visualisation diagram that I designed fit its purpose.

Webpages	Installation
Homepage	Displays my logo brand, includes my picture, search bar and a navigation panel.
CV Page	This used to be titled ' about me ' page. Displays my work experience
Education Page	This used to be titled 'skills page'. Displays my educational background & degree.
Portfolio Page	This used to be titled ' project page '. Displays all my projects.
About me Page	This is a new page that follows the same format as the previous ' about me ' page. Displays my contact.

NOTE: The images was refurbished by CHATGPT and the table is an update on the visualisation diagram analysis.

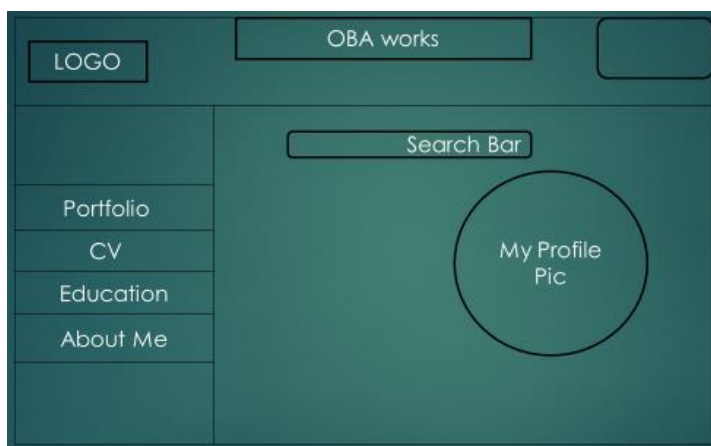

Navigation Plan

In my navigation plan, the home page is at the top because it parent page meaning it represents the website upon access. The other pages are children page which is linked to the home page using a navigation system. I have used hyperlinks and rollover buttons, this helps to improve interactivity of the website showing off my web development skills. The benefit of using this style is that is non-linear allowing the user of the website to access pages.

Screen layouts

Create a template layout design. Include a description of sizes, colours and visual elements.

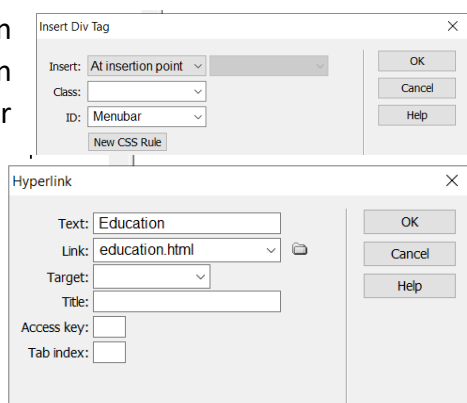

This is the screen layout of the homepage of the website. The main colour used in the website will be black and gold/yellow. The font text will be written in a minimum of **20** font size. At the centre of the page is my initials. I positioned it there as it is the brand identity of the website and it is a common design trend for websites. The brand logo will be placed at the

top left corner of the page because that is a design trend and to also avoid creating confusion upon entry of the page. At the opposite corner is a square box which the home button navigation is placed. Although it not shown on this screen layout because it is the home page. I decided to place the navigation panels on the left side of the homepage for easy accessibility and to not crowd the homepage. I have created this layout to give a greater depth of the homepage.

Production/development

After finalising my website development visualisation diagram and mood board, I started by going to a design software called Adobe Dreamweaver, which allows for websites to be developed. I started by clicking on the insert tool which displayed a variety of panel and I clicked on the **layout object panel** and chose a div tag. A **div tag** creates a layer of box which allows text or images to be added into it. I created two div tags; one for the menu bar and the other for the main content

in the source code. A **source code** is where all the texts, images and videos are placed. This is imbedded in the software. A div tag comes with a **class or id**. Afterwards I used the insert tool again to create a hyperlink. I used the hyperlinks to create each text section of the menu bar because each section linked to a different page on the website. This is a navigation effect that allowed the viewers to navigate around the webpage. I used interactive features to make the website more engaging.

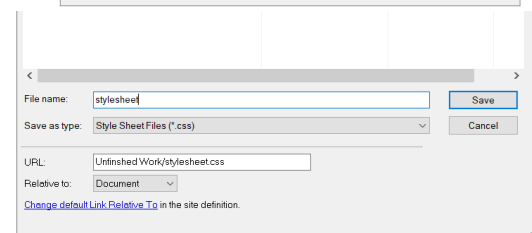

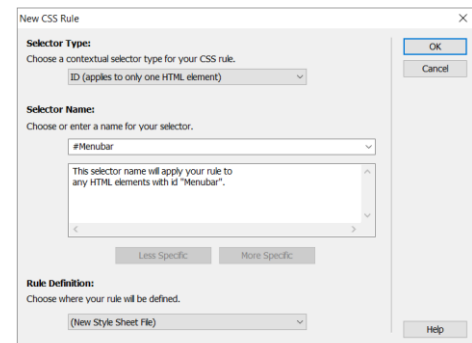

```

9 <div id="Menubar">
10 <a href="home.html">Home</a>
11 <a href="cv.html">CV</a>
12 <a href="portfolio.html">Portfolio </a>
13 <a href="education.html">Education</a>
14 <a href="about_me.html">About Me</a>
15 </div>

```

HomeCVPortfolio EducationAbout Me

Next, I created a stylesheet. A **stylesheet** allows for several **style rules** to be added on the webpage of a website such as background colour, font size and font colour. I then focused on editing the menu bar using the colour scheme required from the client brief; yellow and black. The symbol '#' is used to select the **class or id** by using its name and for the menu bar it was called **menu bar**. I added the style rules between the two brackets. For a style rule to work, it must have an opening and closing bracket and also a semicolon on each rule. For the menu bar, I started by adding a **background colour** and then padding. **Padding** is a style rule that adds space inside an element, around its contents. This was done to create a clear visual aid of the text displayed and it made the menu bar neater. The text was aligned in the centre using the **text-align** rule. This was added to create a hierarchy and also because it is a common design trend used in websites. Then it was given a fixed position to prevent the text from being edited over. Afterwards I added a **backdrop-filter: blur** rule, this allowed for text to be seen when scrolled over menu bar. I did this to create a more sophisticated look. Next, I added **colour, padding and font size rule** to the text in the menu bar. This was done to arrange the format of the menu bar guiding the viewers' eye to key important information first. Afterwards I added a **border radius rule** around

```

1 @charset "utf-8";
2 #Menubar {
3     background-color:rgba(0,0,0,0.8);
4     backdrop-filter:blur(5px);
5     padding:15px;
6     text-align:center;
7     position:fixed;
8     width:100%;
9 }
10
11 #Menubar a {
12     text-decoration:none;
13     color:#FC0;
14     padding:15px;
15     font-size:18px;
16     border-radius:5px;
17     background-color:rgba(255,255,0,0.1);
18 }

```

```

#Menubar p a:hover{
    font-family:Verdana, Geneva, sans-serif;
    background-color:#FC0;
    color:#333;
    transition:all 0.5s ease;
}

```

the text and implemented a **background colour**. This effect was implemented into the menu bar to create round corners around the text. I did this to make the navigation text clearer and more appealing. I then added a **hover effect** with a background colour, change in font colour

and a transition. I did this to increase the level of engagement from the users and to also capture their attention. By adding this effect, it makes the menu bar appear professional.

Afterwards I went to the main content div tag, in this section I pasted random words into the area to allow to see what I would be editing over. Firstly, it was created with an object named **content area**. This was applied to all webpages. By doing this, it ensures that all text had a **standardised font size**, **padding**, **font colour** and **background colour**. It creates a neater and easily readable appeal. Afterwards, I repasted the **hyperlinks** at the bottom of the page to create access to my projects on the other page. This was a design choice I implemented into my website. It was positioned at the bottom to not distract from the welcome message and to also create an easily accessible structure. I then added the coding to give a more pleasing look. To this I created a **style rule with the id in the style sheet** which was linked to all webpages. For example, I added a **border** to give a square box around the text which was given a colour and there afterwards a **'content hover'** style rule to give a better look like a fade in effect. **For this hover effect, I created a reversal look using the original colours used on the page and switched them over; Font Colour – yellow and background – grey and for the hover font colour – black and background yellow.** This style made the website more fashionable and was applied to avoid creating obstruction with text above.

```

25 <div class="Contentarea" id="Welcome">
26 <h1><strong>Hi, I'm Timmy </strong></h1>
27 <h2><strong>Welcome to my website.</strong> </h2>
28 <p>Lorem ipsum dolor sit amet, consectetur adipiscing </p>

padding:100px 25% 100px 25%;
line-height:2.5;
font-size:14px;
background-color:#333;
}

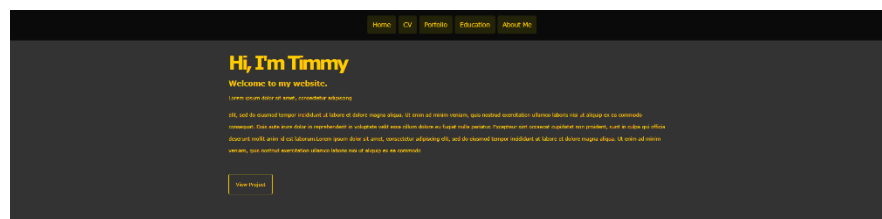

```

```

41 .Contentarea a {
42 border:2px solid #FC0;
43 padding:20px;
44 text-decoration:none;
45 color:#FC0;
46 border-radius:5px;
47 }
48
49 .Contentarea a:hover{
50 background-color:#FC0;
51 color:#474747;
52 }

```

Afterwards I moved onto the CV page. For this section I learnt some videos online on how to create a layout for the cv. I learnt this because I already had a cv and I preferred the template so I learnt how to recreate it on Dreamweaver. For example, the code **LI** which is a bullet point. While the **UL** is a default spacing. Then I pasted the cv into the source code and edited it. But before that I created a **div tag and id** for the cv section. I then created a style rule in the stylesheet where I added code to make the cv page

```

<div class="edu-left">
<p><strong>2023 - 2025</strong><br>
Sweeney Park School<br>
Role: Prefect<br>
Awarded: 100% attendance</p>
<p><strong>GCSE Qualifications:</strong></p>
<ul>
<li>Grade 5 in English Language</li>
<li>Grade 5 in English Literature</li>
<li>Grade 4 in Maths</li>
<li>Grade 4+ in Science</li>
<li>Level 1 Distinction in Hospitality and Catering</li>
<li>Grade 5 in Product Design</li>
<li>Level 2 Pass in Creative Media</li>
<li>Level 2 Merit in Health and Fitness</li>
</ul>
</div>

```

appealing and clear. Firstly, for the headings I created a separate rule. For example, I increased the font size and added a margin top & bottom. A **margin bottom** creates space below the headings and **margin top** creates space above it. I then added a **border bottom**, and it creates a line beneath the headings which I gave colour to flow with the overall appeal of the page. I did this to make it look more presentable. For this page, there was a lot of style rule created as it needed to be very professional and presentable because the viewers must easily understand the concept of the page. Another example is the educational background on the cv page. On the first educational background, I implemented the style rules **padding-right** which creates space towards the right after the text written in that section and **border-right** which places a vertical line on the right-hand side which I also gave the same colour for consistency within the design.

```
#CV h2 {
    margin-top: 3px;
    border-bottom: 2px solid #FC0;
    padding-bottom: 5px;
}
```

added a **border**

gs which I gave

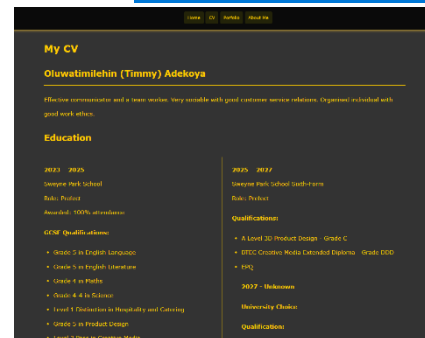

did this to make

a lot of style rule

and presentable

```
.edu-left {
    width: 50%;
    padding-right: 20px;
    border-right: 3px solid #;
}

.edu-right {
    width: 50%;
    padding-left: 20px;
}
```

Moving on to the portfolio page, this was the most complicated stage. To begin with, I went onto google and I pasted a range of text into the source code with separate div tags and id, and gave it headings such as Branding, Photo Manipulation and Web design which was three different paragraphs in total. Thereafter I went to the stylesheet and created three style rule section for each paragraph. As mentioned earlier, I created a content area style rule which gave this section a standard size, background colour, font colour & etc. I then inputted style rule into the photo manipulation paragraph. For example, I gave a different background colour and font colour **which was the reversal of the colour on the page: Font Colour – yellow and background – grey and for the specific paragraph font colour – black and background yellow.**

```
.Contentarea{
    color:#FC0;
    padding:100px 25% 100px 25%;
    line-height:2.5;
    background-color:#333;
}
```

```

<div class="ContentArea" id="logo">
  <h1>strong>branding and logo design</strong> </h1>

```

```
#Photo {
  background-color:#FC0;
  color:#333;
```

This created a more luxurious look to the page. I did this to the paragraph to make it more aesthetically appealing. Afterwards I created hyperlinks for each paragraph at the bottom. This hyperlinks that were created for this specific page linked to a pdf file to give a better detail of the project

portfolio. The process behind is as follows; firstly, the document was in word document which was converted into a pdf file. And secondly, the link on the source code was converted into

the pdf file so upon clicking on it the user would transferred into a pdf file document. The hyperlinks style rule was linked with the other hyperlinks

which

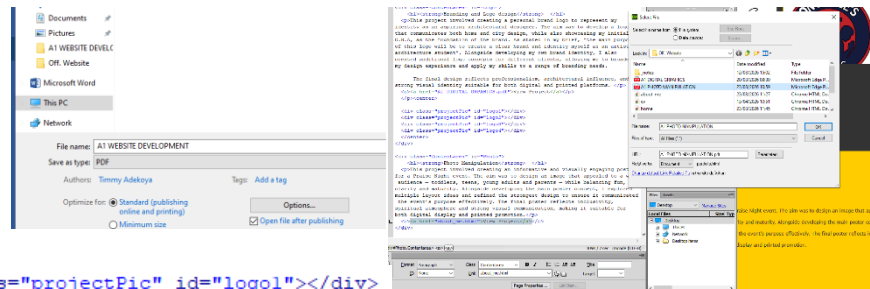

instantly

created the

same effect. Afterwards, I created a div tag and duplicated it four times then I added the **div class & id** into the stylesheet.

This was placed in the first paragraph of the portfolio page to display some of the projects I had created in the past through

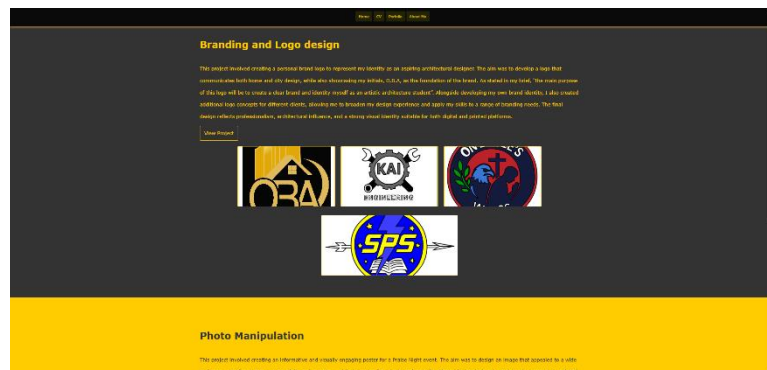

imagery. After which I added in some style rule to make the code presentable such as **background-size** which made the image completely cover the box and the **background position: centre;** keeps the image centred in the box. Then I added a colour border to blend with the look of the page and then added the margin which created space around the box. This effect creates card-like block with an image that filled the background with yellow borders. I did this to make the portfolio page easily more understood.

```
<div class="projectPic" id="logo1"></div>
<div class="projectPic" id="logo2"></div>
<div class="projectPic" id="logo3"></div>
<div class="projectPic" id="logo4"></div>
```

```
.projectPic {
  background-size:cover;
  background-position:center;
  width: 25.5%;
  border: 2px solid #FC0;
  border-radius: 5px;
  margin:10px;
  display:inline-block;
  height:300px;
}
```

```
#Logo center #logo1 {
  background-image:url(../A1%20DIGITAL%20GRAPHICS/logo%20design%20-%20Picture%202.jpg);
}
#Logo center #logo2 {
  background-image:
  url(../Logo%20design%20%20Kai%20development/Kai%20project/Capture.PNG);
}
#Logo center #logo3 {
  background-image:
  url(../Logo%20design%20%20Kai%20development/church%20project/Capture.PNG);
}
#Logo center #logo4 {
  background-image:
  url(../Logo%20design%20%20Kai%20development/school%20project/Capture.PNG);
}
```

Furthermore, I went to about me page where I created a div tag for and typed in my contact details and address where after a little description of my ambition. On this page, I focused on making it appealing and centred as there wasn't much needed to be inputted into the page. I then created a style rules for the page to make it outstanding. Firstly, I added a background colour that flows with the overall flow and rhythm of the website to keep the consistency and also added the text colour. Then I added **margin**; this created a space outside the border, then a **border radius** which gave smooth and sharp corners where after I added in an **outline** which created a square line around the text. Thereafter I

  outline: 4px solid #333;
  columns:2;
  column-width:250px;
  column-gap:50px;
  column-rule: 1px dotted #333;
}
```

added an **outline-offset** which distanced the square line from the text. Afterwards I added **columns** to create a dual fronted page to give better looking feel about the page. I did this to improve the readability and usability of the website and also improve the layout to make professional which enhances the user interaction.

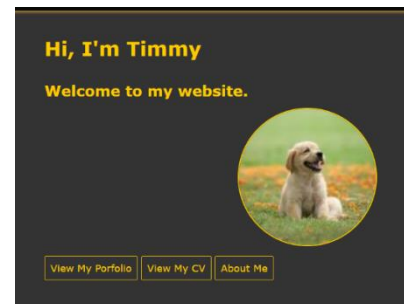

Then after I went back to the homepage where I decided to add a profile picture to represent the identity. To do that, I clicked on the insert tool, clicked on image objects and I clicked the image placeholder. This created a space specifically for the image to be placed afterwards I imported the image into the image

```
.profile-pic {
  width: 500px;
  height: 500px;
  border-radius: 50%;
  object-fit: cover;
  display: block;
  margin: 20px auto;
  border: 4px solid #FC0;
}
```

```

```

placeholder and gave a div class to allow me to edit around the image in the stylesheet. Firstly, I gave a reasonable width and height pixel to make it visible and afterwards I added a border around it which was coloured in yellow as that is the colour scheme for the website. Then I added the effect object-fit; cover; to make sure the image completely covered the area and I added **border radius:50%**; which made the area in which the image was placed rounded/circle. This helps increase user interactivity and gives a brand identity for the website.

Post-production - testing and feedback.

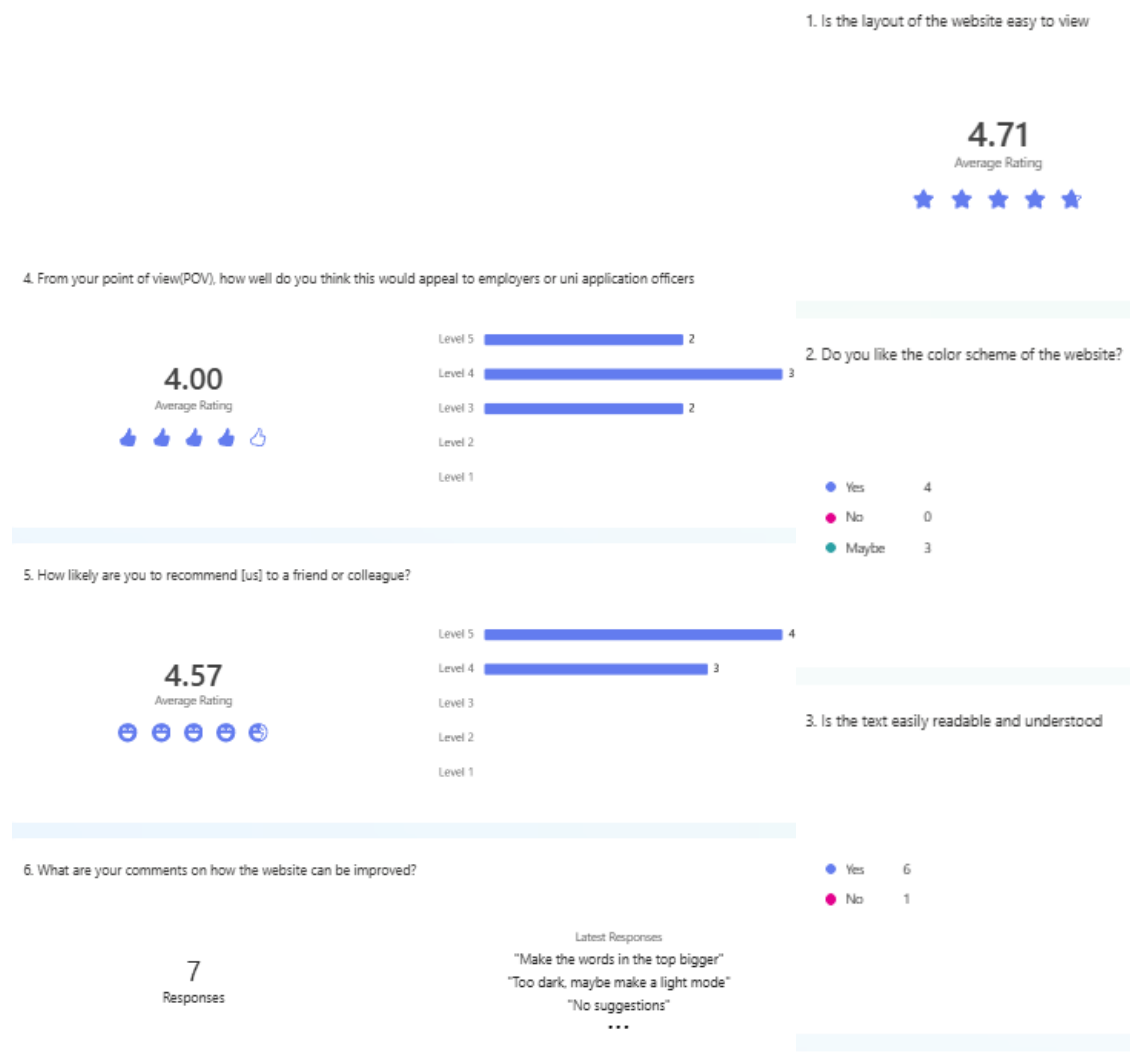

I am my own client and I will be creating a portfolio website for my personal use. I want the website to feature a variety of pages to present my portfolio. The website will be targeted at employers and university application officers both male and female so it must also include my CV. This website is for informing people about my skills, work experience and education. I would like the website to feature a gold and black colour. This colour is to make the website look luxurious and present a professional appearance. On the website, the logo should be on the top left corner of the page.

Client's Question	Why am I asking this?	Designer's answer	Implication on project
1. Does the website feature a variety of pages?	To display my backgrounds in a structural format.	Yes, it does	The website easily achieves requirement as it is multi-page.
2. Is the website targeted at employers and university application officers?	Because the website is a personal portfolio designed for these people.	Yes, it is	The targeted audiences will easily understand the website efficiently.
3. Does the website inform people about my skills, work experience and education?	To help viewers gain an understanding of my capabilities.	Yes, it does	The website includes specific content section to highlight my profile.

4. Does the website follow the gold and black colour scheme?	Because it is the colour of my logo brand which allows me to build a brand identity.	Yes, it does	The website will have a very specific identity
5. Does the website appear luxurious and professional?	To create a sense of high standard.	Yes, it does	This means the website will have a high quality.
6. Is the logo placed on the top left corner of the page?	Because it is common on all website and to increase my reputation.	No, it's not	The brand identity will be missing which is crucial.

Test Plan

Test	Expected Outcome	Pass/Fail	Re-Test	Result
Home Page Navigation Link	To transport the user to the home page.	Pass	N/A	The links works.
CV Page Navigation Link	To transport the user to the CV page.	Pass	N/A	The links works.
Portfolio Page Navigation Link	To transport the user to the Portfolio page.	Pass	N/A	The links works.
About Me Page Navigation Link	To transport the user to the About Me page.	Fail – It transported the user to the wrong page.	A	The button now transports the user to the right page.
Portfolio Button	To transport the user to the Portfolio page.	Fail – It transported the user to the wrong page.	A	The button now transports the user to the right page.
About Me Button	To transport the user to the About Me page.	Pass	N/A	The button works.
CV Button	To transport the user to the CV page.	Fail – It transported the user to the wrong page.	A	The button now transports the user to the right page.
View Project Button 1	To transport the user to a PDF file.	Fail – it didn't work	A	The navigation button now works.
View Project Button 2	To transport the user to a PDF file.	Pass	N/A	The navigation button works.

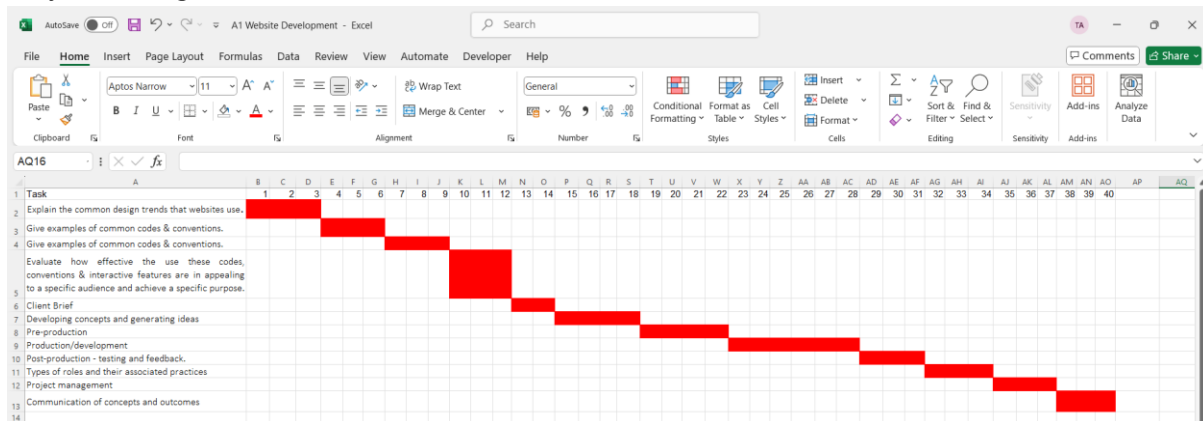

A1.4 Professional skills and behaviours

Types of roles and their associated practices

For this project, I was the client and the web designer. I worked independently to design the project. Although I did most of the work, I had guidance from my teacher who helped made sure every interactive feature worked properly.

A1.5 Presentation and review of final product

Communication of concepts and outcomes

For this Project, I did some online research into personal portfolio websites to give me idea of what design I wanted to implement into the website during development. I started by realising a profile pic would be essential to build identity. Also for the website to stand out it had to adhere to certain design trends and use vibrant colour to capture attention of its viewers as this images clearly illustrate it.

Then I went to Adobe Dreamweaver and using the tools on the software I was able to design the website efficiently

Afterwards, I created a variety of visualisation diagram. By doing this, It helped realised the website before production. It also gave me the chance to give alterations to what fits best for the intended purpose. By creating the visualisation diagrams, it made it easier to understand the key ideas for example the layout and structure to reduce mistakes in the production stages like placing navigation bars/buttons in the wrong place.

This is the website with all pages being displayed: Home, CV, Portfolio and About Me page. In the home I inputted a profile pic to help boost identity and on the CV page, it was structurally arranged to look professional so it best suits its purpose: portfolio website. In the about me, I created the border to make the page more appealing and not boring.

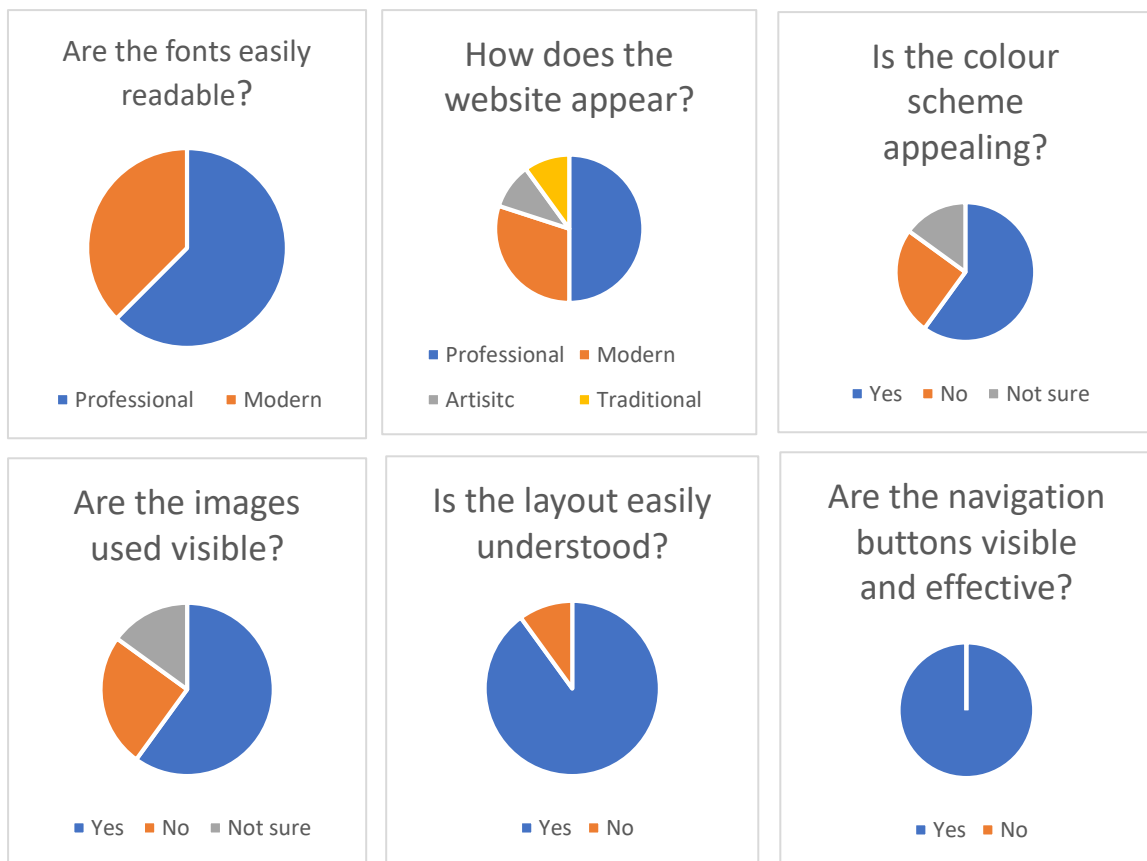

As stated in the client brief, “I want the website to feature a variety of pages” which it clearly does and is also targeted at employers and university application officers. This makes the website very suitable as it achieved its main purpose. The website is very informative and also features the desired colour requested in the client brief. This product fits its purpose as it is appealing to the target audience. It will be used for job and university applications as it was intended for such purpose.

Presentation to peers/client/audience

Audience	Feedback	Response
Mrs Curd	The website is easy to navigate with clear tabs and links to important information. The Home page is simple but the image used is misleading. An image of Timmy himself would be much more appropriate. I like the fact that he has included the project which led to the development of the logo, which I really think has a strong brand identity. I think it would also be a good	Looking at this feedback, I can confidently say the website positively achieved its purpose. Furthermore, I will be changing the image on the home page to avoid misleading the viewers.

	idea to include the logo on the Home page.	
Mr Vano	You have developed a really strong visual identity for your website, with a consistent house style that unifies the whole site. The choice of colour is excellent and gives emphasis to content in the right way. The navigation system works really well and content is very easy to find. The work you have showcased on your website is extremely well presented. You have also made the site responsive which is excellent.	From this feedback, I agree that the website is very functional and interactive as this was purposely done to increase the engagement with the website. The style is very appealing which I agree with.
Hailey	The colour scheme is very creative and I like the effect of using a bold yellow so everything stands out more. It is easy to navigate and information is confidently shown. The personal information is very informative and helps create a greater understanding.	From this feedback, the website is very appealing and it suit its purpose. The colours were inspired by the brand logo which compliments the overall look of the website.
Charlie	I find that all the information is organised effectively and so that it is easy to read and understand for any universities or potential employers. Additionally, I think that the colour scheme is very effective in order to keep the website professional but still remain engaging. The layout also is simple but effective.	From this feedback, I can tell that the website is very informational and professional while maintaining a good and interactive design.
